Geac agrees to resell Entrinsik's Informer Web Reporting Software

April 26, 2005 – Geac's (TSX: GAC, NASDAQ: GEAC) Public Safety Division agreed this week to become a reseller for Entrinsik's Informer Web Reporting Software. Geac Public Safety Division provides leading computer-aided dispatch and records management systems for emergency services such as law enforcement agencies, fire departments and ambulance service companies. Geac continuously pursues a "total solution" approach for their customers and Informer provides a great complement to their existing offering.

"While we provide some report writing capability with our standard software, the Informer product satisfies our customers' desires for a very intuitive web-based reporting solution," said Molly Crews, General Manager of Geac Public Safety Division. "At the end of day, we expect Informer will create happier customers and that will be a win-win for all parties."

Doug Leupen, President of Entrinsik, is proud to announce this reseller agreement on the heels of other similar agreements and partnerships. "Users are responding with glowing reviews, telling us they are relieved to finally have access to their data through such a user-friendly, informative product. We expect Geac customers to respond the same, and plan to work together with Geac to tightly integrate Informer into their environments. "

Informer boasts a host of features providing executives, managers, and key administrators easy interactive web reporting from complex database structures. It provides users direct and fast access to U2 database files utilizing UniObjects while presenting the information intuitively via their browser, then making it available for export to popular desktop applications such as MS Excel and Adobe PDF. Scheduled reports can execute on set intervals and trigger emails with report attachments or links to saved reports on the network. For report customization, users can modify their data views "on the fly" through sorting, grouping, field selection, totals only, and more. A role-based security mechanism, with optional integration into LDAP, controls access to all of Informer's powerful features and also limits backend data availability by role - down to the data element level.
