## Electronic Portfolio Consortium

"The Electronic Portfolio Consortium (ePortConsortium) is the collaboration of higher education and IT institutions working to define, design, and develop software for the forthcoming electronic portfolio environment and system. From a conceptual perspective, we are trying to invent the new electronic portfolio application environment to address various ePortfolios needs. From the technical perspective, we intend to collaborate with IT institutions to define and adopt interoperability and transportability measures and standards while building prototypes to test scenarios and conceptual environments. If we are successful, the forthcoming electronic portfolio systems created by commercial software companies and those built by educational institutions will be compatible."
