The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to

Acknowledgments

The authors wish to thank the many individuals who contributed to the development of the survey and this report. The survey was requested and financially supported by the Office of Educational Technology. Bernard Greene was the NCES Project Officer. Westat's project director was Laurie Lewis, and the survey manager was John Wells. Debbie Alexander directed the data collection efforts, assisted by Ratna Basavaraju and Anjali Pandit. Alla Belenky was the programmer, Carol Litman was the editor, and Sylvie Warren was responsible for formatting the report.

The NCES staff who reviewed the report include Bruce Taylor, Shelley Burns, Val Plisko, Edie McArthur, and Carl Schmitt. The reviewer outside of NCES was Bernadette Adams-Yates of the Office of the Under Secretary, U.S. Department of Education. This report was also reviewed by Mary McLaughlin, Juliet Diehl, Steve Hocker, Stephen Mistler, Jed Tank, and Xiaolei Wang of the Education Statistics Services Institute, American Institutes for Research. In addition, the report was reviewed by Duc-Le To of the Institute of Education Sciences.

We would also like to acknowledge the respondents, without whom this survey would not have been possible.

Summary

Background

The National Center for Education Statistics (NCES) has employed its Fast Response Survey System (FRSS) to track access to information technology in schools and classrooms since 1994. FRSS is designed to administer short, focused, issue-oriented surveys that place minimal burden on respondents and have a quick turnaround from data collection to reporting. Each year, with the exception of 2004, NCES has conducted a new nationally representative survey of public schools to gauge the changes in computer and Internet availability, based on measures such as student-to-computer ratio and the percentage of schools and classrooms with Internet connections. As computers and the Internet became increasingly available in schools, the FRSS surveys were modified to address new issues, such as the use of new types of Internet connections to enhance connectivity. Recent FRSS surveys on Internet access have been expanded to address other emerging issues. The 2002 survey, for instance, included items on the use of technologies or procedures to prevent student access to inappropriate material on the Internet and the availability of teacher professional development on technology use in the classroom. The 2005 survey included items on the use of Internet access to provide various opportunities and information for teaching and learning.

This report presents key findings from the 2005 FRSS survey on Internet access in U.S. public schools and selected comparisons with data from previous FRSS Internet surveys. The 2005 survey, designed to update data on the issues addressed in 2003 and ask about a few new issues, covered the following topics:

- school connectivity, including school and classroom access to the Internet, and types of connections;
- student access to computers and the Internet, including student-to-computer ratio, the provision of hand-held computers to teachers and students, and laptop computers available for loan to students;
- technologies and procedures to prevent student access to inappropriate material on the Internet;
- teacher professional development on how to integrate the use of the Internet into the curriculum; and

- use of Internet access to provide various opportunities and information for teaching and learning.

Questionnaires for the survey “Internet Access in U.S. Public Schools, Fall 2005” were mailed to a representative sample of 1,205 public schools in the 50 states and the District of Columbia. The sample was selected from the 2003–04 NCES Common Core of Data (CCD) Public Elementary/Secondary School Universe File, the most current available at the time of selection. The sampling frame includes about 85,000 regular elementary and secondary/combined schools (a combined school is one that encompasses instruction at both the elementary and secondary levels). The number of schools in the survey universe decreased to an estimated 83,000 after some of the schools were determined during data collection to have been closed or merged with other schools. Data have been weighted to yield national estimates. The unweighted and weighted response rates were both 86 percent. Detailed information about the survey methodology is provided in appendix A, and the questionnaire can be found in appendix B. The focus of this report is twofold: the national estimates for 2005, and statistically significant findings over time. Selected survey findings are presented by the following school characteristics:

- instructional level (elementary, secondary);
- school size (enrollment of less than 300, 300 to 999, 1,000 or more, referred to as small, medium, and large throughout the report);
- locale (city, urban fringe, town, rural);
- percent minority enrollment (less than 6 percent, 6 to 20 percent, 21 to 49 percent, 50 percent or more); and
- percent of students eligible for free or reduced-price lunch (less than 35 percent, 35 to 49 percent, 50 to 74 percent, 75 percent or more), which is used as a measure of poverty concentration at the school. For the remainder of this report, we will refer to the percent of free or reduced-priced lunch as poverty concentration.

In general, comparisons by these school characteristics are presented only where measurable differences were detected and followed meaningful patterns. It is important to note that many of the school characteristics may also be related to each other, and complex interactions and relationships have not been explored here. For example, enrollment size and instructional level of schools are related, with secondary schools typically being larger than elementary schools. Similarly, poverty concentration and minority enrollment are related, with schools with a higher minority enrollment also more likely to have a higher concentration of poverty. This report is purely descriptive in nature, and readers are cautioned not to draw causal inferences based solely on the bivariate results presented in this report. The selected

findings are examples of comparisons that can be made using the data and are not designed to emphasize any particular issue.

All specific statements of comparison made in this report have been tested for statistical significance through *t*-tests adjusted for multiple comparisons using the Bonferroni adjustment,¹ and are significant at the 95 percent confidence level or better. However, only selected findings are presented for each topic in the report. Throughout this report, differences that appear large (particularly those by school characteristics) may not be statistically significant. This absence of statistical significance is due in part to the relatively large standard errors surrounding the estimates and the use of the Bonferroni adjustment to control for multiple comparisons. A detailed description of the statistical tests supporting the survey findings can be found in appendix A.

Selected Findings

The findings are organized to address the following issues: school connectivity, student access to computers and the Internet, technologies and procedures to prevent student access to inappropriate material on the Internet, teacher professional development on how to integrate the use of the Internet into the curriculum, and use of the Internet to provide opportunities and information for teaching and learning.

School Connectivity

The FRSS surveys on Internet access collected information on several key measures of school connectivity. Schools were asked whether they had access to the Internet. Schools with Internet access were also asked about the number of instructional rooms that had at least one computer with Internet access and the types of Internet connections used. Information on the number of instructional rooms with Internet access was combined with information on the total number of instructional rooms in the school to calculate the percentage of instructional rooms with Internet access.²

¹ The Bonferroni adjustment was also used for previous FRSS Internet reports and is used here for continuity of reporting.

² Instructional rooms include classrooms, computer and other labs, library/media centers, and any other rooms used for instructional purposes.

School and Instructional Room Access

- In fall 2005, nearly 100 percent of public schools in the United States had access to the Internet, compared with 35 percent in 1994 (table 1). In 2005, no differences in school Internet access were observed by any school characteristics, which is consistent with data reported previously. There have been virtually no differences in school access to the Internet by school characteristics since 1999 (Parsad and Jones 2005).
- Public schools have made consistent progress in expanding Internet access in instructional rooms. In 2005, 94 percent of public school instructional rooms had Internet access, compared with 3 percent in 1994 (figure 1 and table 2). Across school characteristics, the proportion of instructional rooms with Internet access ranged from 88 to 98 percent.

Figure 1. Percentage of public school instructional rooms with Internet access: Various years, 1994–2005

NOTE: Percentages are based on all public schools. Information on the number of instructional rooms with Internet access was combined with information on the total number of instructional rooms in the school to calculate the percentage of instructional rooms with Internet access. All of the estimates in this report were recalculated from raw data files using the same computational algorithms. Consequently, some estimates presented here may differ trivially (i.e., 1 percent) from results published prior to 2001. See table 2 for detailed data.

Type of Connection

The types of Internet connections used by public schools and the speed at which computers are connected to the Internet have changed over the years. In 1996, dial-up Internet connections (a type of narrowband connection) were used by about three-fourths (74 percent) of public schools having Internet access (Heaviside, Riggins, and Farris 1997). In 2001, 5 percent of public schools used dial-up connections, while the majority of public schools (55 percent) reported using T1/DS1 lines (a type of broadband connection), a continuous and much faster type of Internet connection than dial-up (Kleiner and Farris 2002). Because of the increasing complexity of detailed information on types of connections, the 2002, 2003, and 2005 surveys directly asked whether schools used broadband and narrowband connections.³ Schools also reported whether they used wireless connections to the Internet, the types of wireless connections used, and the number of instructional rooms with wireless connections.

- In 2005, 97 percent of public schools with Internet access used broadband connections to access the Internet (table 3). In 2001 and 2000, 85 percent and 80 percent of the schools, respectively, were using broadband connections.
- In 2005, as in previous years (Parsad and Jones 2005), large schools were more likely than small schools to use broadband connections. Ninety-four percent of small schools reported using broadband connections, compared with nearly 100 percent of large schools (table 3).
- Forty-five percent of public schools with Internet access used wireless connections in 2005, an increase from 32 percent in 2003 (table 4).⁴
- Of the schools using wireless Internet connections in 2005, 97 percent indicated that they used broadband wireless Internet connections, an increase from 92 percent in 2003 (table 4). Across all school characteristics, the percentage of public schools with wireless connections using broadband wireless Internet connections ranged from 92 percent to 99 percent.
- In 2005, 15 percent of all public school instructional rooms had wireless Internet connections (table 5).

³ In 2000 and 2001, respondents were instructed to circle as many types of connections as there were in the school. The 2002, 2003, and 2005 questionnaires directly asked whether the schools used broadband and narrowband connections. See the questionnaire in appendix B for definitions of broadband and narrowband connections. These percentages include schools using only broadband connections, as well as schools using both broadband and narrowband connections. They do not include schools using narrowband connections exclusively. In 2001, 2002, 2003, and 2005, they also included DSL connections, which had not been an option on the 2000 questionnaire.

⁴ A school could use both wireless and wired Internet connections. Wireless Internet connections can be broadband or narrowband.

Student Access to Computers and the Internet

The FRSS surveys on Internet access obtained information on various measures of student access to computers and the Internet. Schools reported the number of instructional computers with Internet access; this information was then combined with enrollment data to compute the ratio of students to instructional computers with Internet access. Schools were also asked about the provision of hand-held computers to students and teachers and laptop computer loans to students.

Students Per Instructional Computer With Internet Access

- The ratio of students to instructional computers with Internet access was computed by dividing the total number of students in all public schools by the total number of instructional computers with Internet access in all public schools (including schools with no Internet access).⁵ In 2005, the ratio of students to instructional computers with Internet access in public schools was 3.8 to 1, a decrease from the 12.1 to 1 ratio in 1998, when it was first measured (figure 2 and table 6). The 2005 ratio of 3.8 to 1 also represents a decrease from 2003, when the ratio of students to instructional computers was 4.4 to 1.
- The ratio of students to instructional computers showed some differences by all school characteristics in 2005 with the exception of poverty level (table 6). For example, small schools had fewer students per computer than did medium-sized and large schools (2.4 to 1 compared with 3.9 to 1 and 4.0 to 1, respectively). In addition, schools with the lowest level of minority enrollment had fewer students per computer than did schools with higher minority enrollments.

⁵ This is one method of calculating students per computer. Another method involves calculating the number of students in each school divided by the number of instructional computers with Internet access in each school and then taking the mean of this ratio across all schools. When “students per computer” was first calculated for this NCES series in 1998, a decision was made to use the first method; this method continues to be used for comparison purposes. A couple of factors influenced the choice of that particular method. There was (and continues to be) considerable skewness in the distribution of students per computer per school. In addition, in 1998, 11 percent of public schools had no instructional computers with Internet access.

Figure 2. Ratio of public school students to instructional computers with Internet access: Various years, 1998–2005

NOTE: The ratio of students to instructional computers with Internet access was computed by dividing the total number of students in all public schools by the total number of instructional computers with Internet access in all public schools (including schools with no Internet access). All of the estimates in this report were recalculated from raw data files using the same computational algorithms. Consequently, some estimates presented here may differ trivially (i.e., 1 percent) from results published prior to 2001. See table 6 for detailed data.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System, “Internet Access in U.S. Public Schools, Fall 1998,” FRSS 69, 1998; “Internet Access in U.S. Public Schools, Fall 1999,” FRSS 75, 1999; “Internet Access in U.S. Public Schools, Fall 2000,” FRSS 79, 2000; “Internet Access in U.S. Public Schools, Fall 2001,” FRSS 82, 2001; “Internet Access in U.S. Public Schools, Fall 2002,” FRSS 83, 2002; “Internet Access in U.S. Public Schools, Fall 2003,” FRSS 86, 2003; and “Internet Access in U.S. Public Schools, Fall 2005,” FRSS 90, 2005.

Provision of Hand-Held Computers

The FRSS surveys collected information on the provision of hand-held computers to students and teachers. Hand-held computers are defined as computers, or personal digital assistants, small enough to be held in one hand. Examples are Palm Pilots or Pocket PCs.

- In 2005, 19 percent of public schools provided hand-held computers to students or teachers for instructional purposes, an increase from 10 percent in 2003 (table 7).⁶

⁶ In 2002 and 2003, schools were asked one question about whether they provided hand-held computers to students or teachers. In 2005, schools were asked separate questions about students and teachers. The responses were combined for 2005 to allow comparisons with previous years.

- In 2005, public schools were more likely to provide hand-held computers to teachers than to students. Seventeen percent of schools reported providing hand-held computers to teachers, compared with 8 percent of schools that reported having provided hand-held computers to students (table 8).

Laptop Computer Loans

Public schools reported whether they lent laptop computers to students and the maximum length of time for which they could be borrowed. Schools that did not lend laptop computers to students were asked about their future plans for such loans; for example, in 2005, schools were asked whether they planned to lend laptop computers to students in the 2006–07 school year.

- In 2005, 10 percent of public schools lent laptop computers to students (table 9).
- Forty-seven percent of schools lending laptop computers reported that students could borrow them for less than 1 week, 17 percent reported that students could borrow them for a period of 1 week to less than 1 month, 16 percent reported lending laptops for the entire school year, and 5 percent reported lending laptops for some other maximum length of time (table 10).
- Of the 90 percent of schools without laptop computers available for loan to students in 2005 (calculated from table 9), 3 percent were planning to make laptops available for students to borrow during the next school year (table 11).

Technologies and Procedures to Prevent Student Access to Inappropriate Material on the Internet

Given the diversity of the information carried on the Internet, student access to inappropriate material is a major concern of many parents and teachers. Moreover, under the Children’s Internet Protection Act (CIPA), no school may receive E-rate⁷ discounts unless it certifies that it is enforcing a policy of Internet safety that includes the use of filtering or blocking technology.⁸ Beginning in 2001, the FRSS surveys on Internet access asked whether public schools used any technologies or procedures to prevent student access to inappropriate material on the Internet, the types of technologies or procedures used, and whether such technologies were used on all computers with Internet access used by students.

⁷ The Education rate (E-rate) program was established in 1996 to make telecommunications services, Internet access, and internal connections available to schools and libraries at discounted rates based upon the income level of the students in their community and whether their location is urban or rural.

⁸ More information about CIPA (Public Law 106–554) can be found at the website of the Schools and Libraries Division, Universal Service Administrative Company (<http://www.sl.universalservice.org/reference/CIPA.asp>). The law is effective for funding year 4 (July 1, 2001, to June 30, 2002) and for all future years. Schools and libraries receiving only telecommunications services are excluded from the requirements of CIPA.

The 2002, 2003, and 2005 surveys also asked about the methods used to disseminate information about the technologies or procedures to students and parents. (More information on the specific types of technologies and procedures is listed in appendix A.)

- In 2005, nearly 100 percent of public schools with Internet access used various technologies or procedures to control student access to inappropriate material on the Internet (table 12). Across all school characteristics, between 99 and 100 percent of schools reported using these technologies or procedures. In addition, 98 percent of these schools used at least one of these technologies or procedures on all Internet-connected computers used by students.
- Among schools using technologies or procedures to prevent student access to inappropriate material on the Internet in 2005, 99 percent used blocking or filtering software (table 13). Ninety-six percent of schools reported that teachers or other staff members monitored student Internet access, 79 percent had a written contract that parents have to sign, 76 percent had a contract that students have to sign, 67 percent used monitoring software, 53 percent had honor codes, and 46 percent allowed access only to their intranet.⁹
- Ninety-five percent of public schools using technologies or procedures to prevent student access to inappropriate material on the Internet indicated that they disseminated the information about these technologies or other procedures via their school policies or rules distributed to students and parents (table 14). Sixty-seven percent did so with a special notice to parents, 57 percent used their newsletters to disseminate this information, 40 percent posted a message on the school website or web page, 28 percent had a notice on a bulletin board at the school, 28 percent had a pop-up message at computer or Internet log on, and 4 percent used a method other than the ones listed above.

Teacher Professional Development on How to Integrate the Use of the Internet Into the Curriculum

Approximately one-half of public school teachers in 1999 reported that they used computers or the Internet for instruction during class time and/or that they assigned their students work that involved research using the Internet (Smerdon et al. 2000). One-third of teachers reported feeling well or very well prepared to use computers and the Internet for instruction. The 2002, 2003, and 2005 FRSS surveys on Internet access asked public schools whether they or their districts provided teacher professional development on how to integrate the use of the Internet into the curriculum in the 12 months prior to the surveys, and the percentage of teachers who attended such professional development.

⁹ An intranet is a controlled computer network similar to the Internet but accessible only to those who have permission to use it. For example, school administrators can restrict student access to only their school's intranet, which may include information from the Internet chosen by school officials, rather than full Internet access. See appendix A for definitions of technologies and procedures.

- In 2005, nationwide, 83 percent of public schools with Internet access indicated that their school or school district had offered professional development to teachers in their school on how to integrate the use of the Internet into the curriculum in the 12 months prior to the fall survey (table 15).
- Thirty-four percent of the schools that offered professional development in 2005 had 1 to 25 percent of their teachers attending such professional development in the 12 months preceding the survey (table 15). Sixteen percent of the schools had 26 to 50 percent of their teachers, 13 percent of the schools had 51 to 75 percent of their teachers, and 36 percent of the schools had 76 percent or more of their teachers attending professional development on how to integrate the use of the Internet into the curriculum in the 12 months preceding the survey. Less than 1 percent of schools reported not having any teachers attending such professional development during this time frame.

Use of the Internet to Provide Opportunities and Information for Teaching and Learning

Public schools reported the various ways in which they used the Internet to provide opportunities and information for teaching and learning.

- Eighty-nine percent of public schools indicated they use the Internet to provide data to inform instructional planning at the school level (table 16). Eighty-seven percent of public schools reported using the Internet to provide assessment results and data for teachers to use to individualize instruction, and 87 percent also reported providing high quality digital content (i.e., learning materials brought in from the Web, such as digital libraries and museums, or any text, images, sounds, and video that have been digitized). Additional uses of the Internet included providing online professional development courses to teachers (51 percent) and providing access for students to online distance learning for courses that are otherwise unavailable at the school, reported by 32 percent.
- There were some differences in the use of the Internet by school characteristics (table 16). For example, secondary schools were more likely than elementary schools to use the Internet for providing teacher professional development through online courses (59 vs. 49 percent). Secondary schools were more likely to provide access for students to online distance learning (57 vs. 24 percent). Rural schools also were more likely to provide access for students to online distance learning than schools in cities and urban fringe areas (43 vs. 25 and 24 percent, respectively). In addition, schools with the lowest level of minority enrollment were less likely than schools with the highest level of minority enrollment to use the Internet to provide assessment results and data for teachers to use to individualize instruction (81 vs. 92 percent).

75 percent or more.....	18	31	53	62	79	89	94	97	99	99	99

¹Data for combined schools are included in the totals and in analyses by other school characteristics but are not shown separately.

²Estimate is rounded to 100 percent for presentation in table.

³Percent minority enrollment was not available for some schools. In 1994, this information was missing for 100 schools. In subsequent years, the missing information ranged from 0 schools to 46 schools. In 2005, this information was missing for 20 schools.

⁴Percent of students eligible for free or reduced-price lunch was not available for some schools. In the 1994 survey, free and reduced-price lunch data came from the Common Core of Data (CCD) only and were missing for 430 schools (percentages presented in this table are based on cases for which data were available). In reports prior to 1998, free and reduced-price lunch data were not reported for 1994. In 1998, a decision was made to include the data for 1994 for comparison purposes. In subsequent years, free and reduced-price lunch information was obtained on the questionnaire, supplemented, if necessary, with CCD data. Missing data ranged from 0 schools (2002, 2003, and 2005) to 10 schools (1999).

NOTE: All of the estimates in this report were recalculated from raw data files using the same computational algorithms. Consequently, some estimates presented here may differ trivially (i.e., 1 percent) from results published prior to 2001. For estimates that are 100 percent, the event defined could have been reported by fewer schools had a different sample been drawn.

75 percent or more.....	75	90	95	93	98

¹Respondents were instructed to circle as many types of connections as there were in the school. The data were then combined to show the percentage of schools using broadband connections. Percentages include schools using only broadband connections, as well as schools using both broadband and narrowband connections. They do not include schools using narrowband connections exclusively. Broadband connections include T3/DS3, fractional T3, T1/DS1, fractional T1, and cable modem connections. In 2001, they also included DSL connections, which had not been on the 2000 questionnaire.

²The 2002, 2003, and 2005 questionnaires directly asked whether the schools used broadband and narrowband connections. Broadband connections include T3/DS3, fractional T3, T1/DS1, fractional T1, cable modem, and DSL connections.

³Data for combined schools are included in the totals and in analyses by other school characteristics but are not shown separately.

⁴Estimate is rounded to 100 percent for presentation in table.

⁵Percent minority enrollment was not available for 9 schools in 2000, 31 schools in 2001, 15 schools in 2002, 28 schools in 2003, and 20 schools in 2005.

⁶Percent of students eligible for free or reduced-price lunch was not available for two schools in 2000 and 2001. This information was available for all schools in 2002, 2003, and 2005.

NOTE: Percentages are based on the percent of public schools with Internet access: 98 percent in 2000, 99 percent in 2001 and 2002, 99.8 percent in 2003, and 99.6 percent in 2005. For estimates that are 100 percent, the event defined could have been reported by fewer schools had a different sample been drawn.

¹Data for combined schools are included in the totals and in analyses by other school characteristics but are not shown separately.

²Percent minority enrollment was not available for some schools. Over the years, the missing information ranged from 0 schools (1999) to 31 schools (2001). In 2005, this information was missing for 20 schools.

³Percent of students eligible for free or reduced-price lunch was not available for some schools. Over the years, the missing information ranged from 0 schools (2002, 2003, and 2005) to 10 schools (1999).

NOTE: The ratio of students to instructional computers with Internet access was computed by dividing the total number of students in all public schools by the total number of instructional computers with Internet access in all public schools (including schools with no Internet access). All of the estimates in this report were recalculated from raw data files using the same computational algorithms. Consequently, some estimates presented here may differ trivially (i.e., 1 percent) from results published prior to 2001.

¹Percentages are based on the 99 percent of public schools with Internet access in 2001 and 2002, 99.8 percent in 2003, and 99.6 percent in 2005.

²Percentages are based on 95 percent of public schools (99 percent with Internet access times 96 percent of public schools using technologies or procedures to prevent student access to inappropriate material on the Internet) in 2001, on 98 percent of public schools (99 percent with Internet access times 99 percent using technologies or procedures to prevent student access to inappropriate material on the Internet) in 2002, on 97 percent of public schools (99.8 percent with Internet access times 97 percent using technologies or procedures to prevent student access to inappropriate material on the Internet) in 2003, and on 100 percent of public schools (99.6 percent with Internet access times 99.6 percent using technologies or procedures to prevent student access to inappropriate materials on the Internet) in 2005.

³Data for combined schools are included in the totals and in analyses by other school characteristics but are not shown separately.

⁴Estimate is rounded to 100 percent for presentation in table.

⁵Percent minority enrollment was not available for 31 schools in 2001, 15 schools in 2002, 28 schools in 2003, and 20 schools in 2005.

⁶Percent of students eligible for free or reduced-price lunch was not available for two schools in 2001.

NOTE: For estimates that are 100 percent, the event defined could have been reported by fewer schools had a different sample been drawn.

¹Data for combined schools are included in the totals and in analyses by other school characteristics but are not shown separately.

²Estimate is rounded to 100 percent for presentation in table.

³Percent minority enrollment was not available for 31 schools in 2001, 15 schools in 2002, 28 schools in 2003, and 20 schools in 2005.

⁴Percent of students eligible for free or reduced-price lunch was not available for two schools in 2001.

NOTE: Percentages are based on 95 percent of public schools (99 percent with Internet access times 96 percent using technologies or procedures to prevent student access to inappropriate material on the Internet) in 2001, on 98 percent of public schools (99 percent with Internet access times 99 percent using technologies or procedures to prevent student access to inappropriate material on the Internet) in 2002, on 97 percent of public schools (99.8 percent with Internet access times 97 percent using technologies or procedures to prevent student access to inappropriate material on the Internet) in 2003, and on 100 percent (99.6 percent with Internet access times 99.6 percent using technologies or procedures to prevent student access to inappropriate material on the Internet) in 2005.

#Rounds to zero.

!Interpret data with caution; the coefficient of variation is greater than 50 percent.

‡Reporting standards not met.

¹Percentages are based on the 99 percent of public schools with Internet access in 2002, 99.8 percent in 2003, and 99.6 percent in 2005.

²Percentages are based on 86 percent of public schools (99 percent with Internet access times 87 percent reporting that they or their district offered professional development to teachers in the school on how to integrate the Internet into the curriculum in the past 12 months) in 2002, on 82 percent of public schools (99.8 percent with Internet access times 82 percent reporting that they or their district offered professional development to teachers in the school on how to integrate the Internet into the curriculum in the past 12 months) in 2003, and on 83 percent of public schools (99.6 percent with Internet access times 83 percent reporting that they or their district offered professional development to teachers in the school on how to integrate the Internet into the curriculum in the past 12 months) in 2005.

³Data for combined schools are included in the totals and in analyses by other school characteristics but are not shown separately.

⁴Percent minority enrollment was not available for 15 schools in 2002, 28 schools in 2003, and 20 schools in 2005.

NOTE: Detail may not sum to totals because of rounding and not reporting where there are too few cases for a reliable estimate.

Technical Notes

The Fast Response Survey System (FRSS) was established in 1975 by the National Center for Education Statistics (NCES), U.S. Department of Education. FRSS is designed to collect small amounts of issue-oriented data with minimal burden on respondents and with a quick turnaround from data collection to reporting.

Sample Selection

The sample of elementary and secondary schools for the “Internet Access in U.S. Public Schools, Fall 2005” was selected from the 2003–04 NCES Common Core of Data (CCD) Public Elementary/Secondary School Universe File, the most up-to-date file available at the time the sample was drawn. Over 98,000 schools are contained in the 2003–04 CCD Public Elementary/Secondary School Universe File. For this survey, regular elementary and secondary/combined schools were selected. Special education, vocational education, and alternative schools were excluded from the sampling frame, along with schools with a highest grade below first grade and those outside the 50 states and the District of Columbia. With these exclusions, the final sampling frame consisted of about 85,000 schools, of which about 63,000 were classified as elementary schools and about 21,000 as secondary/combined schools.¹

A sample of 1,205 schools was selected from the public school frame. To select the sample, the frame of schools was stratified by instructional level (elementary, secondary/combined schools), enrollment size (less than 300 students, 300 to 499, 500 to 999, 1,000 to 1,499, 1,500 or more), and percentage of students eligible for free or reduced-price lunch (less than 35 percent, 35 to 49 percent, 50 to 74 percent, 75 percent or more). Schools in the highest poverty category (schools with 75 percent or more students eligible for free or reduced-price lunch) were oversampled to permit analyses for that category.

¹ During data collection, a number of sampled schools were found to be outside the scope of the survey, usually because they were closed or merged. This reduced the number of schools in the sampling frame to an estimated 82,482.

Respondents and Response Rates

The three-page survey instrument was designed by Westat and NCES to address most of the issues examined in the 2003 survey on Internet access. These issues included access to the Internet in instructional rooms, the types of Internet connections used, laptop loans, hand-held computers for students and teachers, teacher professional development on how to integrate the use of the Internet into the curriculum, technologies and procedures used to prevent student access to inappropriate material on the Internet, and use of the Internet to provide opportunities and information for teaching and learning.

Questionnaires and cover letters were mailed to the principals of the 1,205 sampled schools in early October 2005. The letter introduced the study and requested that the questionnaire be completed by the technology coordinator or person most knowledgeable about Internet access at the school. Respondents were offered the option of completing the survey via the Web or by mail. Telephone follow-up for survey nonresponse and data clarification was initiated in November 2005, and data collection was completed in March 2006. Thirty-four schools were outside the scope of the survey because they had closed or merged with other schools, and 1,012 schools completed the survey. Of the schools that completed the survey, 65 percent completed it by Web, 24 percent completed it by mail, 10 percent completed it by fax, and less than 1 percent completed it by telephone. The unweighted and weighted response rates were both 86 percent.

Imputation for Item Nonresponse

The weighted item nonresponse for questionnaire items was less than 1 percent. The nonresponse rate for a particular item was calculated using the number of responses as the numerator and the estimated number of eligible cases that should have responded to the item as the denominator. Although item nonresponse for key items was very low, missing data were imputed for the 14 items listed in table A-1. No imputation was done for school characteristic variables (e.g., percent minority enrollment) that were created from CCD data. The missing items included both numerical data such as counts of instructional rooms and computers, as well as categorical data such as the provision of hand-held computers to students. The missing data were imputed using a “hot-deck” approach to obtain a “donor” school from which the imputed values were derived. Under the hot-deck approach, a donor school that matched selected characteristics of the school with missing data was identified. The matching characteristics included level, enrollment size class, type of locale, and total number of computers in the school. Once a donor was found, it was used to derive the imputed values for the school with missing

Table A-1. Number of cases with imputed data in the study sample, and number of cases with imputed data the sample represents, by questionnaire items: 2005

Questionnaire item	Respondent sample (unweighted)	National estimate (weighted)
3. Number of computers used for instructional purposes	1	45

18. Percentage of teachers who attended professional development on how to integrate the use of the Internet into the curriculum	3	95
21. Plans to make laptops available for students to borrow during the 2006-2007 school year.....	4	180
23. Provision of hand-held computers to students for instructional purposes.....	1	25

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System, "Internet Access in U.S. Public Schools, Fall 2005," FRSS 90, 2005.

data. For categorical items, the imputed value was simply the corresponding value from the donor school. For numerical items, an appropriate ratio (e.g., the proportion of instructional rooms with wireless Internet connections) was calculated for the donor school, and this ratio was applied to available data (e.g., reported number of instructional rooms) for the recipient school to obtain the corresponding imputed value. All missing items for a given school were imputed from the same donor.

Sampling and Nonsampling Errors

The survey responses were weighted to produce national estimates (table A-2). The weights were designed to adjust for the variable probabilities of selection and differential nonresponse. The findings in this report are based on the sample of schools selected and, consequently, are subject to sampling variability. The standard error is the measure of the variability of estimates due to sampling. It indicates the variability of a sample estimate that would be obtained from all possible samples of a given design and size. Standard errors are used as a measure of the precision expected from a particular sample.

If all possible samples were surveyed under similar conditions, intervals of 1.96 standard errors below to 1.96 standard errors above a particular statistic would include the true population parameter being estimated in about 95 percent of the samples. This is a 95 percent confidence interval. For example, the estimated percentage of instructional rooms with Internet access in 2005 is 94 percent, and the estimated standard error is 1.3 percent. The 95 percent confidence interval for the statistic extends from $94 - (1.3 \times 1.96)$ to $94 + (1.3 \times 1.96)$, or from 91 to 97 percent. The coefficient of variation (“c.v.,” also referred to as the “relative standard error”) expresses the standard error as a percentage of the quantity being estimated. The c.v. of an estimate (y) is defined as $c.v. = (s.e./y) \times 100$. Throughout this report, for any coefficient of variation higher than 50 percent, the data are flagged with the note that they should be interpreted with caution, as the value of the estimate may be unstable.

Table A-2. Number and percentage of responding public schools in the study sample, and estimated number and percentage of public schools the sample represents, by school characteristics: 2005

School characteristic	Respondent sample (unweighted)		National estimate (weighted)

50 to 74 percent.....	217	21	18,289	22
75 percent or more.....	234	23	17,565	21

NOTE: Percent minority enrollment was not available for 20 schools. Thirty-four schools were combined schools and therefore are missing in the instructional level counts used here, but those cases were included in the totals and in analyses by other school characteristics. Detail may not sum to totals because of rounding or missing data.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System, “Internet Access in U.S. Public Schools, Fall 2005,” FRSS 90, 2005.

Differences between two estimates can be examined by comparing the confidence intervals around the two estimates. If the confidence intervals overlap, then differences in the estimates are likely due to sampling variability rather than any real differences in values. In instances where a survey estimate is 100 percent, there is no measured variability around the estimate, and therefore no standard error or confidence interval can be computed. However, for these estimates of 100 percent, the event (e.g., whether the school has access to the Internet) could have been reported by fewer schools had a different sample been selected. When comparing the estimate of 100 percent to another estimate, a confidence interval around the other estimate that includes the 100 percent indicates that the difference in the two estimates is likely due to sampling variability.

For example, the percentage of public schools with access to the Internet located in cities (see tables 1 and 1a) was estimated to be 100 percent in 2003 (with no standard error), and 99.4 percent (which rounds to 99 percent for presentation in the table) in 2005 (with a standard error of 0.6). The 95 percent confidence interval around the 2005 estimate of 99 percent extends from 98.2 percent to greater than 100 percent. Thus, the confidence intervals for the 2003 estimate of 100 percent and the 2005 estimate of 99 percent overlap, and the decrease from 2003 to 2005 can be attributed with a high level of confidence to sampling variability.

Because the data from this survey were collected using a complex sampling design, the sampling errors of the estimates from this survey (e.g., estimates of proportions) are typically larger than would be expected based on a simple random sample. Not taking the complex sample design into account can lead to an underestimation of the standard errors associated with such estimates. To generate accurate standard errors for the estimates in this report, standard errors were computed using a technique known as jackknife replication. As with any replication method, jackknife replication involves constructing a number of subsamples (replicates) from the full sample and computing the statistic of interest for each replicate. The mean square error of the replicate estimates around the full sample estimate provides an estimate of the variance of the statistic. To construct the replications, 50 stratified subsamples of the full sample were created and then dropped one at a time to define 50 jackknife replicates. A computer program (WesVar) was used to calculate the estimates of standard errors. WesVar is a stand-alone Windows application that computes sampling errors from complex samples for a wide variety of statistics (totals, percents, ratios, log-odds ratios, general functions of estimates in tables, linear regression parameters, and logistic regression parameters).

The test statistics used in the analysis were calculated using the jackknife variances and thus appropriately reflect the complex nature of the sample design. In particular, Bonferroni adjustments were made to control for multiple comparisons where appropriate. For example, for an “experiment-wise”

comparison involving g pairwise comparisons, each difference was tested at the $0.05/g$ significance level to control for the fact that g differences were simultaneously tested. The Bonferroni adjustment was also used for previous FRSS Internet reports and is used here to maintain continuity with prior reporting. The Bonferroni adjustment results in a more conservative critical value for judging statistical significance. This means that comparisons that would have been significant with a critical value of 1.96 may not be significant with the more conservative critical value. For example, the critical value for comparisons between any two of the four categories of poverty concentration is 2.64 rather than 1.96.

The survey estimates are also subject to nonsampling errors that can arise because of nonobservation (nonresponse or noncoverage) errors, errors of reporting, and errors made in collection of the data. These errors can sometimes bias the data. Nonsampling errors may include such problems as the difference in the respondents' interpretation of the meaning of the question; memory effects; misrecording of responses; incorrect editing, coding, or data entry; differences related to the particular time the survey was conducted; or errors in data preparation. While general sampling theory can be used in part to determine how to estimate the sampling variability of a statistic, nonsampling errors are not easy to measure and, for measurement purposes, usually require that an experiment be conducted as part of the data collection procedures or that data external to the study be used. To minimize the potential for nonsampling errors, the questionnaire on Internet access in public schools was pretested in 1994, and again each time it was substantially modified. The full questionnaire was last pretested for the fall 2001 survey, since a few new topics were introduced in the survey. Several items added to or modified in the 2005 survey were also pretested. The pretesting was done with public school technology coordinators and other knowledgeable respondents like those who would complete the survey. During the design of the survey, an effort was made to check for consistency of interpretation of questions and to eliminate ambiguous items. The questionnaire and instructions were intensively reviewed by NCES.

Manual and machine editing of the questionnaire responses were conducted to check the data for accuracy and consistency. Cases with missing or inconsistent items were recontacted by telephone to resolve problems. Data were keyed with 100 percent verification for surveys received by mail, fax, or telephone.

Definitions of Terms Used in the Questionnaire

Types of Internet connections

T3/DS3—Dedicated digital transmission of data and voice at the speed of 45 MB per second; composed of 672 channels.

Fractional T3—One or more channels of a T3/DS3 line. Used for data and voice transmission at the speed of less than 45 MB per second.

T1/DS1—Dedicated digital transmission of data and voice at the speed of 1.5 MB per second; composed of 24 channels.

Fractional T1—One or more channels of a T1/DS1 line. Used for data and voice transmission at the speed of less than 1.5 MB per second.

Cable modem—Dedicated transmission of data through cable TV wires at a speed of up to 2 MB per second.

DSL (Digital Subscriber Line)—Refers collectively to ADSL, SDSL, HDSL, and VDSL. DSLs have a dedicated digital transmission speed of up to 32 MB per second.

ISDN (Integrated Services Digital Network)—Sends voice and data over digital telephone lines or normal telephone wires at the speed of up to 128 KB per second.

56 KB—Dedicated digital transmission of data at the speed of 56 KB per second.

Dial-up connection—Data transmission through a normal telephone line upon command, at the maximum speed of 56 KB per second (for example, AOL or Earthlink).

Types of technologies to prevent student access to inappropriate material on the Internet

Blocking software—Uses a list of websites that are considered inappropriate and prevents access to those sites.

Filtering software—Blocks access to sites containing keywords, alone or in context with other keywords.

Monitoring software—Records e-mails, instant messages, chats, and the websites visited.

Intranet—Controlled computer network similar to the Internet, but accessible only to those who have permission to use it. Intranet system managers can limit user access to Internet material.

Definitions of Analysis Variables

Instructional level—Schools were classified according to their grade span in the 2003–04 Common Core of Data (CCD) Public Elementary/Secondary School Universe File. Data for combined schools are included in the totals and in analyses by other school characteristics, but are not shown separately. Thus, data are reported for the following categories:

Elementary school—Had grade 6 or lower and no grade higher than grade 8.

Secondary school—Had no grade lower than grade 7 and had grade 7 or higher.

School size—This variable indicates the total enrollment of students based on data from the 2003–04 CCD Public Elementary/Secondary School Universe File. For sampling purposes, schools were grouped into five enrollment size classes—less than 300 students, 300 to 499, 500 to 999, 1,000 to 1,499, 1,500 or more. Use of the more detailed size categories ensures greater diversity of schools in the sample with respect to size, and permits a more nearly optimal allocation of the sample for estimating school-level characteristics that are correlated with enrollment. Because of the relatively small sample size and large standard errors associated with small cell sizes, the following three combined categories were used for analysis purposes:

Less than 300 students
300 to 999 students
1,000 or more students

Locale—This variable indicates the type of community in which the school is located, as defined in the 2003–04 CCD Public Elementary/Secondary School Universe File (which uses definitions based on U.S. Census Bureau classifications). The variable was based on the eight-category locale variable from CCD and collapsed into the following four categories for this report.

City—A central city of a Consolidated Metropolitan Statistical Area (CMSA) or Metropolitan Statistical Area (MSA).

Urban fringe—Any incorporated place, Census-designated place, or non-place territory within a CMSA or MSA of a large or mid-size city and defined as urban by the Census Bureau.

Town—An incorporated place or Census-designated place with a population greater than or equal to 2,500 and located outside a CMSA or MSA.

Rural—Any incorporated place, Census-designated place, or non-place territory designated as rural by the Census Bureau.

Percent minority enrollment—This variable indicates the percent of students enrolled in the school whose race or ethnicity is classified as one of the following: American Indian or Alaskan Native; Asian or Pacific Islander; Black, non-Hispanic; or Hispanic, based on data in the 2003–04 CCD Public Elementary/Secondary School Universe File. The categories are:

Less than 6 percent
6 to 20 percent
21 to 49 percent
50 percent or more

Percent of students eligible for free or reduced-price lunch—This variable was based on responses to question 25 on the survey questionnaire; if it was missing from the questionnaire (2.0 percent of all cases), it was obtained from the 2003–04 CCD Public Elementary/Secondary School Universe File. This item served as a measurement of the concentration of poverty at the school. The categories are:

Less than 35 percent
35 to 49 percent
50 to 74 percent
75 percent or more

It is important to note that many of the school characteristics used for independent analysis may also be related to each other. For example, school size and locale are related, with city schools typically being larger than rural schools. Similarly, poverty concentration and minority enrollment are related, with schools with a higher minority enrollment also more likely to have a higher concentration of poverty. Other relationships between analysis variables may exist. However, this report focuses on bivariate relationships between the analysis variables and questionnaire variables rather than more complex analyses.

For more information about the survey, contact Bernie Greene, Early Childhood, International, and Crosscutting Studies Division, National Center for Education Statistics, Institute of Education Sciences, U.S. Department of Education, 1990 K Street NW, Washington, DC 20006; e-mail: Bernard.Greene@ed.gov; telephone: (202) 502-7348.

EXPIRATION DATE: 09/2006

INTERNET ACCESS IN U.S. PUBLIC SCHOOLS, FALL 2005

FAST RESPONSE SURVEY SYSTEM

This survey is authorized by law (P.L. 103-382). While you are not required to respond, your cooperation is needed to make the results of this survey comprehensive, accurate, and timely.

IF ABOVE INFORMATION IS INCORRECT, PLEASE MAKE CORRECTIONS DIRECTLY ON LABEL.

Name of person completing form: _____ Telephone: _____

Title/position: _____

Best days and times to reach you (in case of questions): _____

E-mail: _____

THANK YOU. PLEASE KEEP A COPY OF THIS SURVEY FOR YOUR RECORDS.

PLEASE RETURN COMPLETED FORM TO:

IF YOU HAVE ANY QUESTIONS, CONTACT:

WESTAT
Attention: 8096.06.03 – John Wells
1650 Research Boulevard
Rockville, Maryland 20850

John Wells
800-937-8281, ext. 2663
Fax: 800-254-0984
E-mail: johnwells@westat.com

According to the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information is 1850-0733. The time required to complete this information collection is estimated to average 20 minutes per response, including the time to review instructions, search existing data resources, gather the data needed, and complete and review the information collected. If you have any comments concerning the accuracy of the time estimate(s) or suggestions for improving this form, please write to: U.S. Department of Education, Washington, D.C. 20202-4651. If you have comments or concerns regarding the status of your individual submission of this form, write directly to: National Center for Education Statistics, 1990 K Street, N.W., Washington, D.C. 20006

1. What is the total number of **instructional rooms** in your school? (Include all rooms used for any instructional purposes: classrooms, computer labs and other labs, library/media centers, art rooms, rooms used for vocational or special education, etc.) _____ instructional rooms
2. How many **computers** are there in your school? (Do **not** include laptop computers available for loan. Count **all** other computers, including those used by administrators, teachers, and students. If none, please enter "0" and skip to question 19.) _____ computers
3. How many of the **computers** indicated in question 2 are used for **instructional** purposes? (Do **not** include computers used only for administrative purposes. If none, please enter "0.") _____ instructional computers
4. Does your school have access to the Internet?
 Yes..... 1 (Continue with question 5.) No..... 2 (Skip to question 19.)
5. How many **computers** in your school currently have **Internet** access? (Do **not** include laptop computers available for loan. Include all other instructional and noninstructional computers. This number should not exceed the number reported in question 2. If none, please enter "0" and skip to question 19.) _____ computers
6. How many of the **computers** with **Internet** access indicated in question 5 are used for **instructional** purposes? (This number should not exceed the number reported in question 5. If none, please enter "0.") _____ instructional computers
7. What type(s) of connections does your school use when connecting to the Internet? (See **definition box** below. Circle one on each line.)

	Yes	No
a. Broadband connections (e.g., T3/DS3, fractional T3, T1/DS1, fractional T1, cable modem, and/or DSL).....	1	2
b. Narrowband connections (e.g., ISDN, 56KB, and/or dial-up connection)	1	2

Definitions for question 7 and question 10

T3/DS3 – dedicated digital transmission of data and voice at the speed of 45 MB per second; composed of 672 channels.

Fractional T3 – one or more channels of a T3/DS3 line; used for data and voice transmission at the speed of less than 45 MB per second.

T1/DS1 – dedicated digital transmission of data and voice at the speed of 1.5 MB per second; composed of 24 channels.

Fractional T1 – one or more channels of a T1/DS1 line; used for data and voice transmission at the speed of less than 1.5 MB per second.

Cable modem – dedicated transmission of data through cable TV wires at a speed of up to 2 MB per second.

DSL (Digital Subscriber Line) – refers collectively to ADSL, SDSL, HDSL, and VDSL. DSLs have a dedicated digital transmission speed of up to 32 MB per second.

ISDN (Integrated Services Digital Network) – sends voice and data over digital telephone lines or normal telephone wires at the speed of up to 128 KB per second.

56 KB – dedicated digital transmission of data at the speed of 56 KB per second.

Dial-up connection – data transmission through a normal telephone line upon command, at the maximum speed of 56 KB per second (for example, AOL or Earthlink).

8. How many **instructional rooms** have a computer with **Internet** access? (This number should not exceed the number reported in question 1. If none, please enter "0.") _____ instructional rooms
9. Does your school use wireless connections when connecting to the Internet?
 Yes..... 1 (Continue with question 10.) No..... 2 (Skip to question 12.)
10. What type(s) of wireless connections does your school use when connecting to the Internet? (Circle one on each line.)

	Yes	No
a. Broadband connections (e.g., T3/DS3, fractional T3, T1/DS1, fractional T1, cable modem, and/or DSL).....	1	2
b. Narrowband connections (e.g., ISDN, 56KB, and/or dial-up connection)	1	2

11. How many **instructional rooms** use **wireless connections** when connecting to the Internet? (This number should not exceed the number reported in question 1. If none, please enter "0.") _____ instructional rooms

12. Does your school use its **Internet access** to provide the following for teaching and learning? (Circle one on each line.)

	Yes	No
a. Access for students to online distance learning for courses that are otherwise unavailable at the school	1	2
b. Assessment results and data for teachers to use to individualize instruction	1	2
c. Data to inform instructional planning at the school level	1	2
d. Teacher professional development through online courses taken at the school.....	1	2
e. High quality digital content (i.e., learning materials brought in from the web, such as digital libraries and museums, or any text, images, sounds, and video that have been digitized).....	1	2

13. Does your school use any **technology** or other **procedure** to prevent student access to inappropriate material on the Internet?

Yes..... 1 (Continue with question 14.) No..... 2 (Skip to question 17.)

14. What **technologies** or **procedures** does your school use to prevent student access to inappropriate material on the Internet? (See **definition box** below. Circle one on each line.)

	Yes	No
a. Blocking/filtering software	1	2
b. Monitoring software.....	1	2
c. Intranet.....	1	2
d. Monitoring by teachers or other staff	1	2
e. Written contract that parents have to sign	1	2
f. Written contract that students have to sign	1	2
g. Honor code for students	1	2
h. Other (<i>specify</i>) _____	1	2

Definitions for question 14

Blocking software – uses a list of Web sites that are considered inappropriate and prevents access to those sites.

Filtering software – blocks access to sites containing keywords, alone or in context with other keywords.

Monitoring software – records e-mails, instant messages, chats, and Web sites visited.

Intranet – controlled computer network similar to the Internet, but accessible only to those who have permission to use it. Intranet system managers can limit user access to Internet material.

15. Does your school use these technologies or other procedures to prevent student access to inappropriate material on **all** computers with **Internet** access used by students?

Yes..... 1 No..... 2

16. What method(s) does your school use to disseminate information to students and parents about the technologies or other procedures used to prevent student access to inappropriate material on the Internet at your school? (Circle one on each line.)

	Yes	No
a. Notice on bulletin board at school.....	1	2
b. Newsletters	1	2
c. Special notice to parents	1	2
d. Part of school policy/rules distributed to students and parents	1	2
e. Pop-up message at computer or Internet log on	1	2
f. Posted message on the school Web site or Web page.....	1	2
g. Other (<i>specify</i>) _____	1	2

17. In the past 12 months, has your school or district offered professional development for teachers in your school on how to integrate the use of the Internet into the curriculum?

Yes..... 1 (Continue with question 18.) No..... 2 (Skip to question 19.)

18. In the past 12 months, what percentage of teachers in your school attended professional development on how to integrate the use of the Internet into the curriculum? (Circle only one.)

0 percent..... 1
1 to 25 percent..... 2
26 to 50 percent..... 3
51 to 75 percent..... 4
76 to 100 percent..... 5

19. Does your school lend laptop computers to students?

Yes..... 1 (Continue with question 20.) No..... 2 (Skip to question 21.)

20. What is the longest time for which a student may borrow a laptop? (Circle only one.)

Less than 1 week..... 1
1 week to less than 1 month..... 2
1 month to less than 3 months..... 3
3 months to less than 6 months..... 4
6 months to less than the entire school year..... 5
The entire school year..... 6
Other (specify) _____ 7

21. Does your school plan to make laptops available for students to borrow during the 2006–07 school year?

Yes..... 1 No..... 2

22. Does your school provide any **hand-held** computers to teachers for **instructional** purposes? (Examples of hand-held computers are personal digital assistants such as Palm Pilots or Pocket PCs. Include all hand-held computers provided for instructional purposes, including those available for loan. Do **not** include laptop computers.)

Yes..... 1 No..... 2

23. Does your school provide any hand-held computers to **students** for instructional purposes? (Examples of hand-held computers are personal digital assistants such as Palm Pilots or Pocket PCs. Include all hand-held computers provided for instructional purposes, including those available for loan. Do **not** include laptop computers.)

Yes..... 1 No..... 2

24. Which of the following grades are taught at your school? (Circle all that apply.)

PK K 1 2 3 4 5 6 7 8 9 10 11 12 Ungraded

25. What percent of the students in your school are eligible for the federally funded free or reduced-price lunch program?
_____ % (If none, enter "0".)

THANK YOU. PLEASE KEEP A COPY OF THIS SURVEY FOR YOUR RECORDS.
