The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to

Acknowledgments

The authors wish to thank the many individuals who contributed to the development of the survey and this report. The survey was requested by the Office of Educational Technology of the U.S. Department of Education. Bernard Greene was the NCES Project Officer.

Westat's Project Director was Laurie Lewis, and the survey managers were Anne Kleiner and J. Carl Setzer. Debbie Alexander directed the data collection efforts, assisted by Ratna Basavaraju and Anjali Pandit. Robert Delfierro was the programmer, Carol Litman was the editor, and Sylvie Warren was responsible for formatting the report.

The NCES staff who reviewed the report and provided valuable suggestions include Shelley Burns, Edith McArthur, Gail Mulligan, and Val Plisko. Reviewers outside of NCES were Kirk deFord of the Northwest Educational Technology Consortium, and Kevin Bromer, Robin Gurley, Geeta Kotak, Robert Stillwell, and Aparna Sundaram of the Education Statistics Services Institute, American Institutes for Research. This report was also reviewed by Lisa Bridges of the Institute of Education Sciences.

Summary

Background

Nontraditional methods of instructional delivery at the postsecondary level, such as technology-based distance education course offerings, have been a topic of considerable attention and debate. Research on this topic suggests that distance education course offerings and enrollments have proliferated at postsecondary education institutions within recent years (Lewis, Alexander, and Farris 1997; Lewis et al. 1999; Waits and Lewis 2003). There is also some anecdotal evidence that technology-based education at the elementary and secondary levels enables school districts to expand the range of courses available to their students and may facilitate more flexibility in student schedules and instructional delivery (Wildavsky 2001; Doherty 2002; Kennedy-Manzo 2002; Trotter 2002). To date, however, no nationally representative study has examined technology-based distance education availability, course offerings, and enrollments in the nation's elementary and secondary schools. To address this gap, the Office of Educational Technology in the U.S. Department of Education requested the "Distance Education Courses for Public Elementary and Secondary School Students" survey to collect and analyze nationally representative data on technology-based distance education in public elementary and secondary school districts. It provides baseline data, gathered for the 2002–03 12-month school year, on the prevalence of technology-based distance education courses across the nation, as well as estimated enrollments of public elementary and secondary school students in these distance education courses. It also identifies the types of technologies most commonly used for delivering distance education courses. The survey also provides information on districts' reasons for having distance education courses and factors districts report that prevent their expansion of distance education course offerings.

The survey was mailed to public school district superintendents, who were asked to review the questionnaire and determine the person in the district who was best suited to complete it. Suggested respondents were the director of curriculum, the technology coordinator, or the distance education coordinator. Respondents were provided with a definition and description of distance education courses. For this study, distance education courses were defined as credit-granting courses offered to elementary and secondary school students enrolled in the district in which the teacher and students were in different locations. Distance education courses could originate from the respondent's district or from other entities, such as a state virtual school or postsecondary institution. These courses could be delivered via audio, video (live or prerecorded), or Internet or other computer technologies. Additionally, the distance education courses could include occasional face-to-face interactions between the teacher and the students.

Districts were also instructed to include information about distance education Advanced Placement or college-level courses in which students in their district were enrolled. For purposes of this survey, respondents were instructed to exclude information about supplemental course materials, virtual field trips, online homework, staff professional development, or courses conducted mainly via written correspondence.

The survey asked whether there were any public elementary or secondary school students in the district enrolled in distance education courses. Respondents were instructed to report only about distance education enrollments of students regularly enrolled in the district and to include all distance education courses in which students in the district were enrolled, regardless of where the courses originated. If the respondents indicated that there were public elementary or secondary school students in the district enrolled in distance education courses, they were asked to report the number of schools in their district with students enrolled in distance education courses by instructional level of the school. Respondents were also asked to report the number of distance education course enrollments in schools in their district by instructional level of the school and curriculum area. Other survey items asked which technologies were used as primary modes of instructional delivery for distance education courses, which entities delivered distance education courses, whether any students accessed online distance education courses (and if so, from which locations), and the district's reasons for having distance education courses. Finally, respondents were asked whether their district had any plans to expand their distance education courses, and if so, which factors, if any, might be keeping them from expanding those courses.

This survey was conducted by the National Center for Education Statistics (NCES) using the Fast Response Survey System (FRSS). FRSS is designed to administer short, focused, issue-oriented surveys that place minimal burden on respondents and have a quick turnaround from data collection to reporting. Questionnaires for the survey were mailed in fall 2003 to a representative sample of 2,305 public school districts in the 50 states and District of Columbia. The sample was selected from the 2001–02 NCES Common Core of Data (CCD) “Local Education Agency Universe Survey” file, which was the most current file available at the time of selection. Data have been weighted to yield national estimates. The sampling frame includes 15,218 public school districts—14,229 regular public school districts and 989 “other education agencies” with at least 1 charter school (see appendix A for a more detailed discussion of the sample and sampling frame). The number of districts in the survey universe decreased to an estimated 15,040 because some of the districts were determined to be ineligible for the FRSS survey during data collection. The unweighted response rate was 94 percent and the weighted response rate was 96 percent. Detailed information about the survey methodology is provided in appendix A, and the questionnaire can be found in appendix B.

The primary focus of this report is to present national estimates. In addition, selected survey findings are presented by the following district characteristics, which are defined in more detail in appendix A:

- district enrollment size (less than 2,500, 2,500 to 9,999, 10,000 or more—referred to as small, medium, and large, respectively);
- metropolitan status (urban, suburban, rural);
- region (Northeast, Southeast, Central, West); and
- poverty concentration (less than 10 percent, 10 to 19 percent, 20 percent or more—referred to as low, medium, and high, respectively).

In general, comparisons by these district characteristics are presented only where significant differences were detected and followed meaningful patterns. It is important to note that many of the district characteristics used for independent analysis may also be related to each other. For example, district enrollment size and metropolitan status are related, with urban districts typically being larger than rural districts. Other relationships between these analysis variables may exist. However, this E.D. TAB report focuses on the bivariate relationships between district characteristics and the data gathered in the survey, rather than more complex analyses, to provide descriptive information about technology-based distance education.¹

All specific statements of comparison made in this report have been tested for statistical significance through *t*-tests and are significant at the 95 percent confidence level or better. However, only selected findings are presented for each topic in the report. Throughout this report, differences that may appear large (particularly those by district characteristics) may not be statistically significant. This may be due to relatively large standard errors surrounding the estimates, particularly among subgroups. A detailed description of the statistical tests supporting the survey findings can be found in appendix A.

Selected Findings

The findings in this report are organized as follows:

- distance education courses for public school students;

¹ E.D. TAB reports focus on the presentation of selected descriptive data in tabular format.

- technologies used for delivering distance education courses;
- entities delivering distance education courses;
- reasons for having distance education courses; and
- future expansion of distance education courses.

Distance Education Courses for Public School Students

The survey asked whether there were any public elementary or secondary school students in the district enrolled in distance education courses in 2002–03 (12-month school year). Districts with students enrolled in distance education courses were asked to indicate the number of schools with at least one student enrolled in distance education courses and the number of enrollments in distance education courses of students regularly enrolled in the district.

Prevalence of Distance Education Courses in Public School Districts

- During the 2002–03 12-month school year, about one-third of public school districts (36 percent) had students in the district enrolled in distance education courses (table 1). This represents an estimated 5,500 out of a total of 15,040 public school districts.
- A greater proportion of large districts than medium or small districts had students enrolled in distance education courses (50 vs. 32 and 37 percent, respectively) (table 1). In addition, a greater proportion of districts located in rural areas than in suburban or urban areas indicated that they had students enrolled in distance education courses (46 compared with 28 and 23 percent, respectively).
- A greater proportion of districts located in the Southeast and Central regions had students enrolled in distance education courses than did districts in the Northeast and West (45 and 46 percent compared with 21 and 32 percent) (table 1). The proportion of districts with students enrolled in distance education courses was lower in the Northeast than in other regions (21 vs. 32 to 46 percent).
- A smaller proportion of districts with the lowest poverty concentration had students enrolled in distance education courses than did districts with higher concentrations of poverty (33 compared with 42 percent for both districts with medium or high poverty concentration) (table 1).

Prevalence of Distance Education Courses in Public Schools

- An estimated 8,200 public schools had students enrolled in distance education courses during the 2002–03 12-month school year (table 2). This represents approximately 9 percent of all public schools nationwide (table 3).
- Although a greater proportion of large districts than medium or small districts had students enrolled in distance education courses (table 1), a greater proportion of schools in small districts had students enrolled in distance education courses than did schools in medium or large districts (15 vs. 6 percent for both medium and large districts) (table 3). In other words, when small districts do offer distance education, they are more likely to involve a greater proportion of their schools.
- A higher proportion of schools in rural districts than schools in either suburban or urban districts had students enrolled in distance education courses (15 compared to 7 and 5 percent, respectively) (table 3). In addition, a greater proportion of schools in the Central region had students enrolled in distance education courses than did schools in the Northeast (12 vs. 5 percent, respectively).
- The percentage of schools with students enrolled in distance education courses varied substantially by the instructional level of the school. Overall, 38 percent of public high schools offered distance education courses, compared with 20 percent of combined or ungraded schools,² 4 percent of middle or junior high schools, and fewer than 1 percent of elementary schools (table 3).
- Among all public schools with students enrolled in distance education, 76 percent were high schools, 15 percent were combined or ungraded schools, 7 percent were middle or junior high schools, and 2 percent were elementary schools (table 4 and figure 1).

² Combined or ungraded schools are those in which the grades offered in the school span both elementary and secondary grades or that are not divided into grade levels.

Figure 1. Percentage distribution of public schools with students enrolled in distance education courses, by instructional level: 2002–03

¹ Combined or ungraded schools are those in which the grades offered in the school span both elementary and secondary grades or that are not divided into grade levels.

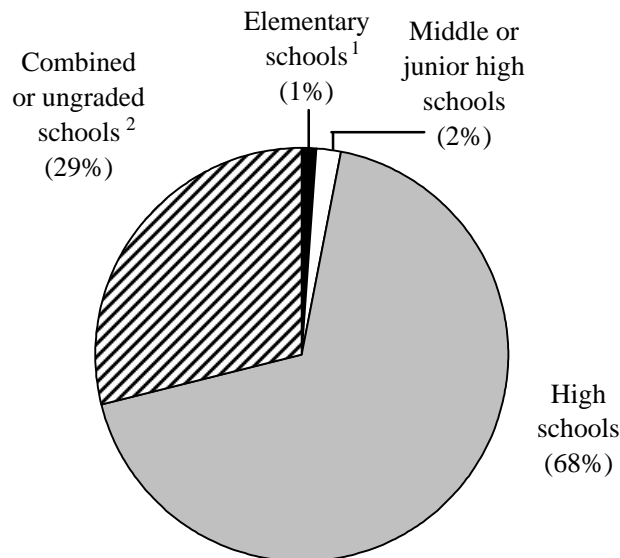

NOTE: Percentages are based on unrounded numbers. Percentages are based on the estimated 8,210 schools with students enrolled in distance education courses in 2002–03.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System (FRSS), "Distance Education Courses for Public School Elementary and Secondary School Students: 2002–03," FRSS 84, 2003.

Distance Education Enrollments by Instructional Level

- In 2002–03, there were an estimated 328,000 enrollments in distance education courses among students regularly enrolled in public school districts³ (table 5). If a student was enrolled in multiple courses, districts were instructed to count the student for each course in which he or she was enrolled. Thus, enrollments may include duplicated counts of students.
- Of the total enrollments in distance education courses, 68 percent were in high schools, 29 percent were in combined or ungraded schools, 2 percent were in middle or junior high schools, and 1 percent⁴ were in elementary schools (table 6 and figure 2).

Figure 2. Percentage distribution of enrollments in distance education courses of students regularly enrolled in the districts, by instructional level: 2002–03

¹ Interpret data with caution. The coefficient of variation for elementary schools is greater than 50 percent.

² Combined or ungraded schools are those in which the grades offered in the school span both elementary and secondary grades or that are not divided into grade levels.

NOTE: Percentages are based on unrounded numbers. Percentages are based on the estimated 327,670 enrollments in distance education courses in 2002–03.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System (FRSS), "Distance Education Courses for Public School Elementary and Secondary School Students: 2002–03," FRSS 84, 2003.

³ To put this number into context, NCES reported 47,222,778 students enrolled in public elementary and secondary schools in fall 2000. It is important to note that distance education enrollments collected in the FRSS survey may include duplicated counts of students (i.e., the number of students enrolled in distance education courses could be smaller than the estimated 328,000 enrollments in distance education courses), while the NCES estimate of 47,222,778 students enrolled in public elementary and secondary schools is an unduplicated count (Snyder and Hoffman 2003, p. 51).

⁴ Interpret data with caution. The coefficient of variation for elementary schools is greater than 50 percent.

Distance Education Enrollments by Curriculum Area

- Distance education enrollments in various curricular areas ranged from an estimated 8,200 in general elementary school curriculum and 11,700 in computer science to 74,600 in social studies/social sciences (table 7).
- About one-quarter (23 percent) of all enrollments in distance education courses of students regularly enrolled in the districts were in social studies/social sciences, 19 percent were in English/language arts, 15 percent were in mathematics, 12 percent were in natural/physical science, 12 percent were in foreign languages, and 14 percent were in other unspecified curriculum areas (table 8). Enrollments in general elementary school curriculum and computer science accounted for the smallest proportions of distance education enrollments (3 and 4 percent, respectively).
- The proportion of students enrolled in foreign language distance education courses was greater for small districts compared to medium or large districts (19 vs. 11 and 6 percent, respectively) (table 8). Furthermore, the proportion of students enrolled in foreign language distance education courses was greater for rural districts than for suburban or urban districts (22 vs. 10 and 5 percent, respectively).

Advanced Placement or College-Level Courses Offered Through Distance Education

- Fifty percent of the districts with students enrolled in distance education courses had students enrolled in Advanced Placement or college-level courses offered through distance education in 2002–03 (table 9). This represents an estimated 2,700 districts.
- There were an estimated 45,300 enrollments in Advanced Placement or college-level courses offered through distance education in 2002–03 (table 10). This represents 14 percent of the total enrollments in distance education.
- The proportion of all distance education enrollments that are in Advanced Placement or college-level distance education courses is greater in small districts compared to medium or large districts (24 vs. 10 and 7 percent, respectively) (table 10).
- The proportion of all distance education enrollments that are in Advanced Placement or college-level distance education courses is greater in rural districts compared to urban or suburban districts (27 vs. 4 and 11 percent, respectively) (table 10). Additionally, suburban districts had a higher proportion (11 percent) of all distance education enrollments in Advanced Placement or college-level distance education courses than urban districts (4 percent).

Technologies Used for Delivering Distance Education Courses

Districts that reported offering distance education courses were asked about the types of technologies used as primary modes of instructional delivery for any distance education courses in which students in the district were enrolled. The technologies included Internet courses using synchronous (i.e., simultaneous or “real-time”) computer-based instruction, Internet courses using asynchronous (i.e., not simultaneous) computer-based instruction, two-way interactive video, one-way prerecorded video, and other technologies. Districts were also asked about online distance education courses, including where students were accessing distance education courses, and whether the district provided or paid for specific services (i.e., computer, Internet service provider, other) for students accessing online distance education courses from home.

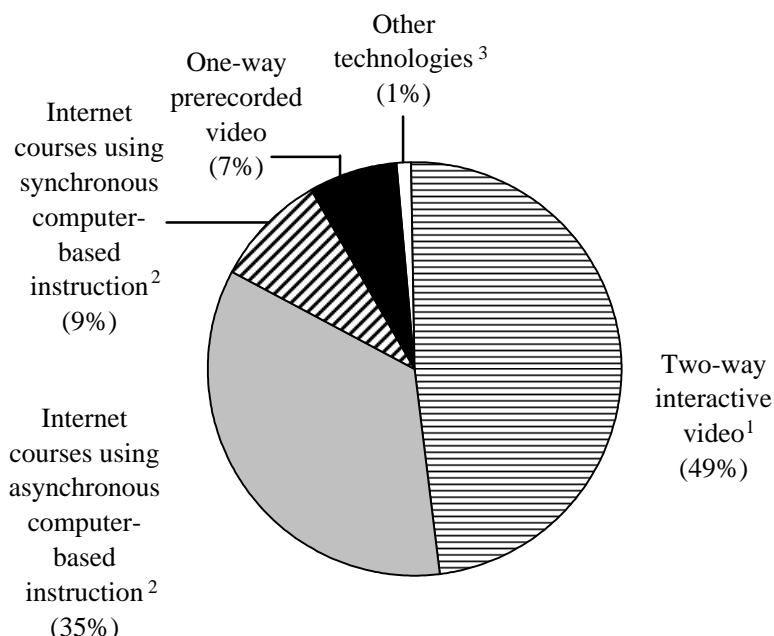

Technologies Used as Primary Modes of Instructional Delivery

- More districts reported two-way interactive video (55 percent) or Internet courses using asynchronous computer-based instruction (47 percent) than Internet courses using synchronous computer-based instruction (21 percent), one-way prerecorded video (16 percent), or some other technology (4 percent) as a primary mode of delivery (table 11).⁵
- In small districts, two-way interactive video was the technology most often cited as a primary instructional delivery mode for distance education courses (60 percent vs. 5 to 42 percent for all remaining technologies) (table 11). However, in both medium and large districts, Internet courses using asynchronous computer-based instruction was the technology most often cited as a primary delivery mode (60 percent vs. 3 to 44 percent for all remaining technologies in medium districts; 72 percent vs. 6 to 33 percent for all remaining technologies in large districts).
- In both urban and suburban districts, Internet courses using asynchronous computer-based instruction was the technology cited most often as a primary instructional delivery mode for distance education courses (69 percent vs. 3 to 38 percent for all remaining technologies in urban districts; 58 percent vs. 4 to 39 percent for all remaining technologies in suburban districts) (table 11). However, in rural districts, two-way interactive video was the technology cited most often as a primary delivery mode (64 vs. 5 to 40 percent for all remaining technologies).

⁵ Percentages sum to more than 100 because some districts used different types of technology as primary modes of instructional delivery for different distance education courses.

- When asked which technology was used to deliver the greatest number of distance education courses, 49 percent of districts selected two-way interactive video, more than any other technology (table 12). Thirty-five percent of districts selected Internet courses using asynchronous computer-based instruction, 9 percent selected Internet courses using synchronous computer-based instruction, 7 percent selected one-way prerecorded video, and 1 percent selected other technologies (table 12 and figure 3).

Figure 3. Percentage distribution of districts reporting that various technologies were used for the greatest number of distance education courses in which students in their district were enrolled: 2002–03

¹ Two-way interactive video refers to two-way video with two-way audio.

² Asynchronous is not simultaneous, whereas synchronous is defined as simultaneous or “real-time” interaction.

³ Other technologies mentioned included teleconferencing, CD-ROM, and other software packages.

NOTE: Percentages are based on unrounded numbers. Percentages are based on the estimated 5,480 districts with students enrolled in distance education courses in 2002–03. Detail may not sum to totals because of rounding.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System (FRSS), “Distance Education Courses for Public School Elementary and Secondary School Students: 2002–03,” FRSS 84, 2003.

Online Distance Education Courses

- Fifty-nine percent of districts with students enrolled in distance education courses had students enrolled in online distance education courses (i.e., courses delivered over the Internet) in 2002–03 (table 13).
- A greater proportion of large districts than medium or small districts had students enrolled in online distance education courses (80 vs. 71 and 53 percent, respectively) (table 13). Medium districts also had a greater proportion of students enrolled in online

distance education courses than small districts (71 vs. 53 percent, respectively). In addition, a smaller proportion of rural districts than suburban or urban districts had students enrolled in online distance education courses (51 vs. 71 and 74 percent, respectively).

- Of those districts with students enrolled in online distance education courses, 92 percent had students accessing online courses from school, 60 percent had students accessing online courses from home, and 8 percent had students accessing online courses from some other location⁶ (table 13).
- A greater proportion of large districts than medium or small districts had students accessing online distance education courses from home (77 vs. 66 and 55 percent, respectively) (table 13). Furthermore, a greater proportion of medium-size districts than small districts had students accessing online distance education courses from home (66 vs. 55 percent). In addition, the proportion of rural districts with students accessing online distance education courses from home was less than the proportion of suburban and urban districts with students accessing online courses from home (53 vs. 67 and 78 percent, respectively). No differences were detected in online access from home by poverty concentration.
- Among districts with students accessing online distance education courses from home, 24 percent provided or paid for a computer for all students and 8 percent did so for some students (table 14). Additionally, 27 percent provided or paid for the Internet service provider for all students and 7 percent did so for some students. Finally, 6 percent provided or paid for some other item (e.g., software programs, phone service for dial-up Internet service) for all students and 2 percent did so for some students.
- A greater proportion of small districts than medium or large districts provided or paid for computers for all students (29 vs. 17 and 11 percent, respectively) (table 14). Similarly, a greater proportion of small districts than medium or large districts provided or paid for an Internet service provider for all students (32 vs. 20 and 15 percent, respectively). In addition, the proportion of rural districts that provided or paid for computers for all students was greater than the proportion of suburban or urban districts that provided or paid for computers for all students (33 vs. 16 and 9 percent, respectively).

Entities Delivering Distance Education Courses

Districts that reported offering distance education courses were asked which entities delivered distance education courses to students regularly enrolled in their district. Entities included

- a cyber (i.e., online) charter school in the district;
- other schools in the district;
- their district (i.e., delivered centrally from the district);

⁶ Percentages sum to more than 100 because students in districts could access online courses from more than one location.

- another local school district, or schools in another district, in their state;
- education service agencies within their state (e.g., Board of Cooperative Educational Services [BOCES], Council on Occupational Education [COE], Intermediate Units [IU]), not including the state education agency or local school districts;
- a state virtual school in their state (i.e., state-centralized K–12 courses available through Internet- or web-based methods);
- a state virtual school in another state;
- districts or schools in other states (other than state virtual schools);
- a postsecondary institution;
- an independent vendor; and
- other entities.

Districts were also asked whether they delivered distance education courses to students who were not regularly enrolled in their district (e.g., to students from other districts, private school students, or homeschooled students).

Entities Delivering Courses

- Of those districts with students enrolled in distance education courses in 2002–03, about half (48 percent) had students enrolled in distance education courses delivered by a postsecondary institution (table 15). Thirty-four percent of districts had students enrolled in distance education courses delivered by another local school district, or schools in other districts, within their state. Eighteen percent of districts had students enrolled in distance education courses delivered by education service agencies within their state, 18 percent by a state virtual school within their state, and 18 percent by an independent vendor. Sixteen percent of districts had students enrolled in distance education courses delivered centrally from their own district. Eight percent of districts had students enrolled in distance education courses delivered by other schools in the district (other than cyber charter schools). The proportion of school districts delivering distance education courses through various other entities ranged from 3 to 4 percent.
- A greater proportion of large districts than medium or small districts had students enrolled in distance education courses delivered by other schools in the district (28 vs. 15 and 5 percent, respectively) (table 16). Medium districts also had a greater proportion of students enrolled in distance education courses delivered by other schools in the district than small districts (15 vs. 5 percent). Additionally, a greater proportion of urban districts than either suburban or rural districts had students enrolled in distance education courses delivered by other schools in the district (25 vs. 9 and 6 percent, respectively).

- A greater proportion of small districts than medium or large districts had students enrolled in distance education courses delivered by another local school district, or schools in other districts, within their state (39 percent vs. 25 and 13 percent, respectively) (table 16). Furthermore, a greater proportion of medium-size districts than large districts had students enrolled in distance education courses delivered by another local school district, or schools in other districts, within their state (25 vs. 13 percent). Additionally, there were more rural districts than either suburban or urban districts that had students enrolled in distance education courses delivered by another local school district, or schools in other districts, within their state (40 percent vs. 25 and 20 percent, respectively).
- A smaller proportion of small districts than medium or large districts had students enrolled in distance education courses delivered by a state virtual school in their state (15 vs. 27 percent each, respectively) (table 16). Additionally, a greater proportion of districts in the Southeast than in other regions had students enrolled in distance education courses delivered by a state virtual school in their state (43 vs. 6 to 17 percent).
- A greater proportion of small districts than medium or large districts had students enrolled in distance education courses delivered by postsecondary institutions (54 vs. 30 and 33 percent, respectively) (table 16). In addition, there was a smaller proportion of urban districts than suburban or rural districts that had students enrolled in distance education courses delivered by postsecondary institutions (22 vs. 44 and 53 percent, respectively).
- There was a greater proportion of large districts than small districts with students enrolled in distance education courses delivered by independent vendors (28 vs. 16 percent, respectively) (table 16). Compared to rural districts, both urban and suburban districts had greater proportions of students enrolled in distance education courses delivered by independent vendors (15 vs. 29 and 23 percent, respectively).

Delivery of Courses to Students Not Regularly Enrolled in the District

- During the 2002–03 12-month school year, about one-fifth (21 percent) of districts that offered distance education delivered courses to students who were not regularly enrolled in the district (e.g., to students from other districts, private school students, or homeschooled students) (table 17).
- A smaller proportion of districts in the Southeast than in the Northeast or Central regions delivered distance education courses to students not regularly enrolled in the district (13 vs. 29 and 22 percent, respectively) (table 17).

Reasons for Having Distance Education Courses

Districts who reported offering distance education courses were asked how important various reasons were for having distance education courses in the district in 2002–03. Reasons included offering courses not otherwise available at the school, offering Advanced Placement or college-level courses, addressing growing populations and limited space, reducing scheduling conflicts for students, permitting students who failed a course to take it again, meeting the needs of specific groups of students, and generating more district revenues.⁷

- The reason most frequently cited as very important for having distance education courses in the district was offering courses not otherwise available at the school (80 percent) (table 18). Other reasons frequently cited as very important were meeting the needs of specific groups of students (59 percent) and offering Advanced Placement or college-level courses (50 percent). Reducing scheduling conflicts for students was mentioned as very important by 23 percent of districts. The remaining reasons were listed as very important by 4 to 17 percent of districts.
- Generating more district revenues as well as addressing growing populations and limited space were rated as not important more often than other reasons for having distance education courses (77 and 72 percent, respectively, vs. 9 to 64 percent) (table 18).
- A greater proportion of small districts than medium or large districts rated offering courses not otherwise available at the school as a somewhat or very important reason for having distance education (93 vs. 86 and 82 percent, respectively) (table 19). In addition, a greater proportion of rural districts than urban or suburban districts considered this to be a somewhat or very important reason for offering distance education courses (95 vs. 79 and 86 percent, respectively).
- A greater proportion of high-poverty districts than medium- or low-poverty districts rated meeting the needs of specific groups of students as a somewhat or very important reason for having distance education (88 vs. 79 and 80 percent, respectively) (table 19).
- A greater proportion of small districts than medium or large districts rated offering Advanced Placement or college-level courses as a somewhat or very important reason for having distance education (74 vs. 54 and 59 percent, respectively) (table 19). In addition, a greater proportion of rural districts than urban or suburban districts cited this as a somewhat or very important reason for having distance education (76 vs. 49 and 59 percent, respectively).
- A greater proportion of large districts than medium or small districts cited reducing scheduling conflicts for students as a somewhat or very important reason for having distance education (70 vs. 52 and 56 percent, respectively) (table 19).

⁷ Although respondents were able to specify some other reason for having distance education, the only available options for this response were somewhat important and very important (see appendix B). Therefore, these “other” responses are not discussed further.

- A greater proportion of large districts than medium or small districts reported permitting students who failed a course to take it again as a somewhat or very important reason for having distance education (50 vs. 34 and 30 percent, respectively) (table 19). In addition, a greater proportion of urban districts than suburban or rural districts cited this reason as somewhat or very important for having distance education (47 vs. 33 and 31 percent, respectively) (table 19).
- A greater proportion of large districts than medium or small districts rated addressing growing populations and limited space as a somewhat or very important reason for having distance education (44 vs. 33 and 21 percent, respectively) (table 19). Furthermore, a smaller proportion of small districts than medium districts rated this as a somewhat or very important reason for having distance education (21 vs. 33 percent, respectively).
- A greater proportion of high-poverty districts than low-poverty districts cited generating more district revenues as a somewhat or very important reason for having distance education (21 vs. 11 percent, respectively) (table 19).

Future Expansion of Distance Education Courses

Districts that reported offering distance education courses were asked whether they planned to expand their distance education courses in the future. Those districts that planned to expand were asked about the extent to which various factors, if any, might be keeping them from expanding distance education courses. The factors included course development and/or purchasing costs; limited technological infrastructure to support distance education; concerns about course quality; restrictive federal, state, or local laws or policies; concerns about receiving funding based on student attendance for distance education courses; or some other reason.

- Seventy-two percent of districts with students enrolled in distance education courses planned to expand their distance education courses in the future (table 20). No differences were detected by district characteristics in plans to expand distance education courses.
- Costs were cited as a major factor more often than any other factor as preventing districts from expanding their distance education courses (table 21). Thirty-six percent of districts that were planning to expand their distance education courses selected course development and/or purchasing costs as a major factor preventing their expansion (table 21).
- Fifty-four percent of districts that were planning to expand their distance education courses said restrictive federal, state, or local laws or policies were not a factor preventing them from expanding (table 21). In addition, districts said the following were not factors preventing them from expanding distance education courses: limited technological infrastructure to support distance education (41 percent), concerns about

receiving funding for distance education courses based on student attendance (40 percent), and concerns about course quality (30 percent).

- Among public school districts with plans to expand their distance education courses, approximately two-thirds (68 percent) said course development and/or purchasing costs were a moderate or major factor keeping the district from expanding distance education courses, followed by concerns about course quality (37 percent); concerns about receiving funding for distance education courses based on attendance (36 percent); limited infrastructure to support distance education (33 percent); restrictive federal, state, or local laws or policies (17 percent); and some other reason (10 percent) (table 22 and figure 4).
- A greater proportion of urban districts than rural districts cited restrictive federal, state, or local laws or policies as a major or moderate factor preventing expansion of distance education courses (30 vs. 15 percent, respectively) (table 22). Additionally, a greater proportion of urban districts than suburban or rural districts cited receiving funding based on attendance for distance education courses as a major or moderate factor preventing them from expanding (54 vs. 38 and 34 percent, respectively).
- A smaller proportion of districts in the Northeast than in other regions cited receiving funding based on attendance for distance education courses as a major or moderate factor preventing expansion (20 vs. 36 to 43 percent) (table 22).

Figure 4. Percent of districts indicating that various factors were preventing them from expanding distance education courses to a moderate or major extent: 2002–03

¹ Other responses mentioned included scheduling conflicts, staffing issues, and lack of need.

NOTE: Percentages are based on unrounded numbers. Percentages are based on the estimated 3,960 districts that indicated they were planning to expand distance education courses.

¹ Combined or ungraded schools are those in which the grades offered in the school span both elementary and secondary grades or that are not divided into grade levels.

NOTE: Percentages are based on unrounded numbers. Enrollments may include duplicated counts of students, since districts were instructed to count a student enrolled in multiple courses for each course in which he or she was enrolled. For the FRSS study sample, there were 3 cases for which district enrollment size was missing and 112 cases for which poverty concentration was missing. Detail may not sum to totals because of rounding or missing data.

Central	108,140	14,380	13
West	118,450	19,490	16
Poverty concentration			
Less than 10 percent	77,380	12,040	16
10 to 19 percent	97,300	16,890	17
20 percent or more	93,280	15,120	16

! Interpret data with caution. The coefficient of variation is greater than 50 percent.

NOTE: Percentages are based on unrounded numbers. Enrollments may include duplicated counts of students, since districts were instructed to count a student enrolled in multiple courses for each course in which he or she was enrolled. Percentages presented in this table are based on the estimated 327,670 enrollments in distance education courses in 2002–03. For the FRSS study sample, there were 3 cases for which district enrollment size was missing and 112 cases for which poverty concentration was missing. Detail may not sum to totals because of rounding or missing data.

Table 11. Percent of districts reporting that various technologies were used as primary modes of instructional delivery for any distance education courses in which students in their district were enrolled, by district characteristics: 2002–03

District characteristic	Internet courses using synchronous computer-based instruction ¹	Internet courses using asynchronous computer-based instruction ¹	Two-way interactive video ²	One-way prerecorded video	Other technologies ³
All public school districts	21	47	55	16	4
District enrollment size					
Less than 2,500	19	42	60	16	5
2,500 to 9,999	21	60	44	15	3
10,000 or more	31	72	33	19	6
Metropolitan status					
Urban	21	69	38	20	3
Suburban	24	58	39	14	4
Rural	19	40	64	16	5
Region					
Northeast	19	47	54	8	12
Southeast	30	52	48	19	5
Central	21	41	58	16	2
West	15	56	53	18	4
Poverty concentration					
Less than 10 percent	18	55	46	13	4
10 to 19 percent	25	42	55	17	4
20 percent or more	17	45	64	16	6

¹ Synchronous refers to simultaneous or “real-time” interaction, whereas asynchronous is defined as not simultaneous.

² Two-way interactive video refers to two-way video with two-way audio.

³ Other technologies mentioned included teleconferencing, CD-ROM, and other software packages.

NOTE: Percentages are based on unrounded numbers. Percentages are based on the estimated 5,480 districts with students enrolled in distance education courses in 2002–03. Percentages sum to more than 100 because some districts used different types of technologies as primary modes of instructional delivery for different distance education courses.

Technical Notes

Fast Response Survey System

The Fast Response Survey System (FRSS) was established in 1975 by the National Center for Education Statistics (NCES), U.S. Department of Education. FRSS is designed to collect issue-oriented data within a relatively short timeframe. FRSS collects data from state education agencies, local education agencies, public and private elementary and secondary schools, public school teachers, and public libraries. To ensure minimal burden on respondents, the surveys are generally limited to three pages of questions, with a response burden of about 30 minutes per respondent. Sample sizes are relatively small (usually about 1,000 to 1,500 respondents per survey) so that data collection can be completed quickly. Data are weighted to produce national estimates of the sampled education sector. The sample size permits limited breakouts by classification variables. However, as the number of categories within the classification variables increases, the sample size within categories decreases, which results in larger sampling errors for the breakouts by classification variables.

Sample Design

The sample for the FRSS survey on distance education courses consisted of 2,305 public school districts in the 50 states and the District of Columbia. It was selected from the 2001–02 NCES Common Core of Data (CCD) Local Education Agency Universe file, which was the most current file available at the time of selection. The sampling frame included 14,229 regular public school districts and 989 “other education agencies” with at least one charter school. For the purposes of the study, “regular” school districts included any local school district that was not a component of a supervisory union (i.e., Education Agency type 1 on the CCD), or was a local school district component of a supervisory union sharing a superintendent and administrative services with other local school districts (i.e., Education Agency type 2 on the CCD). Excluded from the sampling frame were districts in the outlying U.S. territories and regular districts with no enrollments.

The school district sampling frame was stratified by district type (regular or charter), enrollment size (less than 1,000, 1,000 to 2,499, 2,500 to 9,999, 10,000 to 99,999, and 100,000 or more), and percentage of children in the district ages 5–17 in families living below the poverty level (less than

10 percent, 10 to 19.99 percent, 20 to 29.99 percent, and 30 percent or more).¹ Districts in the frame were then sorted by type of locale (urban, suburban, rural) and region (Northeast, Southeast, Central, West) to induce additional implicit stratification. These variables are defined in more detail in the Definitions of Analysis Variables section of this report.

Data Collection and Response Rates

Questionnaires and cover letters for the study were mailed to the superintendent of each sampled district in November 2003. The letter introduced the study and requested that the questionnaire be completed by the district's director of curriculum and instruction, the technology coordinator, the distance education coordinator, or another staff member who was most knowledgeable about the district's distance education courses. Respondents were offered the option of completing the survey via the Web or by mail. Telephone follow-up for survey nonresponse and data clarification was initiated in December 2003 and completed at the end of April 2004.

To calculate response rates, NCES uses standard formulas established by the American Association of Public Opinion Research.² Thus, unit response rates (RRU) are calculated as the ratio of the weighted number of completed interviews (I) to the weighted number of in-scope sample cases. There are a number of different categories of cases that make up the total number of in-scope cases, including

- I = weighted number of completed interviews;
- R = weighted number of refused interview cases;
- O = weighted number of eligible sample units not responding for reasons other than refusal;
- NC = weighted number of noncontacted sample units known to be eligible;
- U = weighted number of sample units of unknown eligibility, with no interview; and
- e = estimated proportion of sample units of unknown eligibility that are eligible.

¹ Poverty estimates for school districts were based on Title I data provided to the U.S. Department of Education by the Bureau of the Census and contained in U.S. Department of Commerce, Bureau of the Census, Current Population Survey (CPS) "Small Area Income and Poverty Estimates, Title I Eligibility Database, 1999." The No Child Left Behind Act of 2001 directs the Department of Education to distribute Title I basic and concentration grants directly to school districts on the basis of the most recent estimates of children in poverty. For income year 1999, estimates were derived for districts according to their 2001–02 boundaries based on 2000 census data and model-based estimates of poverty for all counties. For detailed information on the methodology used to create these estimates, please refer to www.census.gov/hhes/www/saie.html.

² See American Association for Public Opinion Research (AAPOR), *Standard Definitions: Final Dispositions of Case Codes and Outcome Rates for Surveys* (Ann Arbor, MI: AAPOR, 2000). Note that for this report, there were no sampled units with unknown eligibility.

The unit response rate represents a composite of the components as follows:

$$RRU = \frac{I}{I + R + O + NC + e(U)}$$

Of the 2,305 districts in the sample, 10 were found to be ineligible for the survey because they no longer existed. Another three were found to be ineligible because they did not meet some other criteria for inclusion in the sample (e.g., the district was composed of only one school, which was a charter school that offered only prekindergarten classes, and thus was ineligible for the sample). This left a total of 2,292 eligible districts in the sample. Completed questionnaires were received from 2,158 districts, or 94 percent of the eligible districts³ (table A-1). The weighted response rate was 96 percent. The weighted number of eligible districts in the survey represent the estimated universe of public school districts in the 50 states and the District of Columbia. The estimated number of districts in the survey universe decreased from the 15,218 districts in the sampling frame to an estimated 15,040 because some of the districts were determined to be ineligible for the FRSS survey during data collection.

³ Approximately 40 percent of surveys were completed via mail, 29 percent via the Web, 13 percent via phone, and 12 percent via fax.

Table A-1. Number and percent of public school districts in the study, and the estimated number and percent in the nation, for the total sample and for districts with students regularly enrolled in distance education courses in 2002–03, by district characteristics: 2003

District characteristic	Total sample				Districts with students regularly enrolled in distance education courses in 2002–03			
	Respondents (unweighted)		National estimate (weighted)		Respondents (unweighted)		National estimate (weighted)

Imputation for Item Nonresponse

Although item nonresponse was very low, data were imputed for all missing questionnaire data. These 29 items are listed in table A-2. The missing items included both numerical data, such as counts of enrollments in distance education courses, and categorical data, such as which technologies were used as primary modes of instructional delivery for distance education courses. The missing data were imputed using a “hot-deck” approach to obtain a “donor” district from which the imputed values were derived. Under the hot-deck approach, a donor district that matched selected characteristics of the district with missing data (the recipient district) was identified. The matching characteristics included district type, region, metropolitan status, district enrollment size class, and poverty concentration. Once a donor was found, it was used to derive the imputed values for the district with missing data. For categorical items, the imputed value was simply the corresponding value from the donor district. For numerical items, the imputed value was calculated by taking the donor’s response for that item (e.g., number of distance education course enrollments) and dividing that number by the total number of students enrolled in the donor district. This ratio was then multiplied by the total number of students enrolled in the recipient district to provide an imputed value. All missing items for a given district were imputed from the same donor whenever possible.

Data Reliability

While the “Distance Education Courses for Public Elementary and Secondary School Students” survey was designed to account for sampling error and to minimize nonsampling error, estimates produced from the data collected are subject to both types of error. Sampling error occurs because the data are collected from a sample rather than a census of the population, and nonsampling errors are errors made during the collection and processing of the data.

Table A-2. Number of cases with imputed data in the study sample, and number of cases with imputed data the sample represents, by questionnaire items: 2003

Questionnaire item		Respondent sample (unweighted)	National estimate (weighted)
Q4A	Total number of distance education course enrollments	3	14
Q4B	Number of distance education course enrollments in elementary schools	2	9
Q4C	Number of distance education course enrollments in middle or junior high schools	4	18
Q4D	Number of distance education course enrollments in high schools	5	23
Q4E	Number of distance education course enrollments in combined or ungraded schools.....	2	6
Q5A	General elementary school curriculum	2	9
Q5B	English/language arts.....	5	25
Q5C	Social studies/social sciences (including history)	5	25
Q5D	Computer science	5	25
Q5E	Natural/physical science (e.g., biology, chemistry, physics).....	5	25
Q5F	Mathematics	5	25
Q5G	Foreign languages.....	5	25
Q5H	Other (specify).....	1	1
Q5I	Total number of enrollments across curriculum areas	4	21
Q6	Whether any students regularly enrolled in the district were enrolled in Advanced Placement or college-level courses offered through distance education.....	1	2
Q6ENRL	Number of enrollments.....	5	20
Q7A	Internet courses using synchronous (i.e., simultaneous or “real-time”) computer-based instruction	2	9
Q7B	Internet courses using asynchronous (i.e., not simultaneous) computer-based instruction.....	2	9
Q7C	Two-way interactive video (i.e., two-way video with two-way audio)	1	4
Q7D	One-way prerecorded video (including prerecorded videos provided to students, and television broadcast and cable transmission using prerecorded videos)	2	9
Q8	Which one of the technologies was used for the greatest number of distance education courses.....	1	4
Q13A	Provide computer	2	6
Q13B	Provide Internet service provider.....	2	6
Q13C	Provide other (specify).....	1	4
Q14	Whether the district delivered any distance education courses to students who were not regularly enrolled in the district	1	1
Q16A	Course development and/or purchasing costs	1	7
Q16B	Limited technological infrastructure to support distance education	1	7
Q16D	Restrictive federal, state, or local laws or policies	3	15
Q16E	Concerns about receiving funding based on student attendance for distance education courses	1	15

SOURCE: U.S. Department of Education, National Center for Education Statistics, Fast Response Survey System (FRSS), “Distance Education Courses for Public School Elementary and Secondary School Students: 2002–03,” FRSS 84, 2003.

Sampling Errors

The responses were weighted to produce national estimates (see table A-1). The weights were designed to adjust for the variable probabilities of selection and differential nonresponse. The findings in this report are estimates based on the sample selected and, consequently, are subject to sampling variability. General sampling theory was used to estimate the sampling variability of the estimates and to test for statistically significant differences between estimates.

The standard error is a measure of the variability of an estimate due to sampling. It indicates the variability of a sample estimate that would be obtained from all possible samples of a given design and size. Standard errors are used as a measure of the precision expected from a particular sample. If all possible samples were surveyed under similar conditions, intervals of 1.96 standard errors below to 1.96 standard errors above a particular statistic would include the true population parameter being estimated in about 95 percent of the samples. This is a 95 percent confidence interval. For example, the estimated percentage of public school districts with students regularly enrolled in distance education courses is 36.4 percent and the standard error is 1.2 percent (see tables 1 and 1-A). The 95 percent confidence interval for the statistic extends from $[36.4 - (1.2 \times 1.96)]$ to $[36.4 + (1.2 \times 1.96)]$, or from 34.0 to 38.8 percent. The 1.96 is the *critical value* for a statistical test at the 0.05 significance level (where 0.05 indicates the 5 percent of all possible samples that would be outside the range of the confidence interval).

Because the data from the FRSS distance education courses survey were collected using a complex sampling design, the variances of the estimates from this survey (e.g., estimates of proportions) are typically different from what would be expected from data collected with a simple random sample. Not taking the complex sample design into account can lead to an underestimation of the standard errors associated with such estimates. To generate accurate standard errors for the estimates in this report, standard errors were computed using a technique known as jackknife replication. As with any replication method, jackknife replication involves constructing a number of subsamples (replicates) from the full sample and computing the statistic of interest for each replicate. The mean square error of the replicate estimates around the full sample estimate provides an estimate of the variance of the statistic. To construct the replications, 50 stratified subsamples of the full sample were created and then dropped 1 at a time to define 50 jackknife replicates. A computer program (WesVar) was used to calculate the estimates of standard errors. WesVar is a stand-alone Windows application that computes sampling errors from complex samples for a wide variety of statistics (totals, percents, ratios, log-odds ratios, general functions of estimates in tables, linear regression parameters, and logistic regression parameters).

Where appropriate, estimates with a coefficient of variation (CV) greater than 50 percent have been noted. The CV is a ratio of the standard error to the estimate, multiplied by 100 to obtain a percent. The CV is used to compare the variability of two or more estimates, where higher CV values indicate greater variability and lower CV values indicate less variability.

Nonsampling Errors

Nonsampling error is the term used to describe variations in the estimates that may be caused by population coverage limitations and data collection, processing, and reporting procedures. The sources of nonsampling errors are typically problems like unit and item nonresponse,⁴ differences in respondents' interpretations of the meaning of questions, response differences related to the particular time the survey was conducted, and mistakes made during data preparation. It is difficult to identify and estimate either the amount of nonsampling error or the bias caused by this error. To minimize the potential for nonsampling error, this study used a variety of procedures, including a pretest of the questionnaire with directors of curriculum and instruction or other people at the district who were deemed to be the most knowledgeable about the district's distance education courses. The pretest provided the opportunity to check for consistency of interpretation of questions and definitions and to eliminate ambiguous items. The questionnaire and instructions were also extensively reviewed by NCES and the data requester at the Office of Educational Technology. In addition, manual and machine editing of the questionnaire responses was conducted to check the data for accuracy and consistency. Cases with missing or inconsistent items were recontacted by telephone to resolve problems. Data were keyed with 100 percent verification for surveys received by mail, fax, or telephone.

Definitions of Analysis Variables

District Enrollment Size—This variable indicates the total number of students enrolled in the district based on data from the 2001–02 CCD. Data on this variable were missing for three districts; districts with missing data were excluded from all analyses involving district enrollment size. The variable was collapsed into the following three categories:

Less than 2,500 students
2,500 to 9,999 students
10,000 or more students

⁴ Unit nonresponse typically refers to situations in which the survey was not completed by the respondent. Item nonresponse occurs when an item on the survey is blank or incomplete.

Metropolitan Status—This variable indicates the type of community in which the district is located, as defined in the 2001–02 CCD (which uses definitions based on U.S. Census Bureau classifications). Metropolitan status is the classification of an education agency’s service area relative to a Metropolitan Statistical Area (MSA). An MSA is an area consisting of one or more contiguous counties (cities and towns in New England) that contain a core area with a large population nucleus, as well as adjacent communities having a high degree of economic and social integration with that core. An area is defined as an MSA if it is the only MSA in the immediate area and has a city of at least 50,000 population or it is an urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 (75,000 in New England). The categories are described in more detail below.

Urban—Primarily serves a central city of an MSA

Suburban—Serves an MSA but not primarily its central city

Rural—Does not serve an MSA

Region—This variable classifies districts into one of the four geographic regions used by the Bureau of Economic Analysis of the U.S. Department of Commerce, the National Assessment of Educational Progress, and the National Education Association. Data were obtained from the 2001–02 CCD Local Education Agency Universe file. The geographic regions are

Northeast—Connecticut, Delaware, District of Columbia, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont

Southeast—Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, and West Virginia

Central—Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin

West—Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oklahoma, Oregon, Texas, Utah, Washington, and Wyoming

Poverty Concentration—This variable indicates the percentage of children in the district ages 5–17 in families living below the poverty level, based on the Title I data provided to the U.S. Department of Education by the Bureau of the Census. Data on this variable were missing for 112 districts; districts with missing data were excluded from all analyses involving poverty concentration. The variable was collapsed into the following three categories:

Less than 10 percent

10 to 19 percent

20 percent or more

U.S. DEPARTMENT OF EDUCATION
NATIONAL CENTER FOR EDUCATION STATISTICS
WASHINGTON, D.C. 20006-5651

**DISTANCE EDUCATION COURSES FOR PUBLIC ELEMENTARY AND
SECONDARY SCHOOL STUDENTS: 2002-03
FAST RESPONSE SURVEY SYSTEM**

O.M.B. APPROVED
No.: 1850-0733

This survey is authorized by law (P.L. 103-382). While participation in this survey is voluntary, your cooperation is critical to make the results of this survey comprehensive, accurate, and timely.

- **Distance education courses are credit-granting courses offered to elementary and secondary school students enrolled in your district in which the teacher and students are in different locations. These courses:**
 - may originate from your district or from other entities (e.g., a state virtual school or a postsecondary institution).
 - can be delivered via audio, video (live or prerecorded), or Internet or other computer technologies, including both synchronous (i.e., simultaneous or "real time") and asynchronous (i.e., not simultaneous) instruction.
 - may include occasional face-to-face interactions between the teacher and the students. For example, a teacher teaching a course at several schools via video-conferencing may rotate between schools, or the teacher and students may be in the same location for occasional lab work or tests.
- **Include information about distance education Advanced Placement or college-level courses in which students in your district were enrolled.**
- **For purposes of this survey, do *not* include information about:**
 - supplemental course materials, virtual field trips, online homework, or staff professional development.
 - courses conducted mainly via written correspondence.
- **Include information for all schools administered by your district (e.g., regular schools, charter schools, magnet schools, alternative schools, special education schools, etc.).**
- **The time frame for this survey is the 12-month 2002-03 school year.** This includes distance education courses during the summer of 2002 or the summer of 2003, depending on how records are kept at your district.

IF ABOVE INFORMATION IS INCORRECT, PLEASE MAKE CORRECTIONS DIRECTLY ON LABEL.

Name of person completing form: _____ Telephone: _____

Title/position: _____ E-mail: _____

Best days and times to reach you (in case of questions): _____

THANK YOU. PLEASE KEEP A COPY OF THIS SURVEY FOR YOUR RECORDS.

PLEASE RETURN COMPLETED FORM TO:

Anne Kleiner (7166.29)
Westat
1650 Research Boulevard
Rockville, Maryland 20850-3195

IF YOU HAVE ANY QUESTIONS, CONTACT:

Anne Kleiner at Westat
800-937-8281, Ext. 2710 or 240-453-2710
Fax: 800-254-0984
E-mail: annekleiner@westat.com

According to the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 1850-0733. The time required to complete this information collection is estimated to average 30 minutes per response, including the time to review instructions, search existing data resources, gather the data needed, and complete and review the information collection. If you have any comments concerning the accuracy of the time estimate or suggestions for improving this form, please write to: U.S. Department of Education, Washington, DC 20202-4651. If you have any comments or concerns regarding the status of your individual submission of this form, write directly to: National Center for Education Statistics, 1990 K Street, NW, Washington, DC 20006.

Before you answer the questions, please carefully read the instructions and definitions on the front of this questionnaire.

1. In 2002–03 (12-month school year), how many schools were in your district? *Please include all schools administered by your district (e.g., regular schools, charter schools, magnet schools, alternative schools, special education schools, etc.). Enter “0” if there were no schools in your district at that instructional level in 2002–03.*

- a. **Total number of schools**..... _____
- b. Number of elementary schools..... _____
- c. Number of middle or junior high schools..... _____
- d. Number of high schools..... _____
- e. Number of combined or ungraded schools _____

- *The number of enrollments may include duplicated counts of students; i.e., a student should be counted for each course in which he/she was enrolled.*
- *Report only about distance education enrollments of students regularly enrolled in your district.*
- *Take into account any distance education courses in which students in your district were enrolled, regardless of where the courses originated (i.e., from your district or another entity).*
- *Include enrollments in distance education Advanced Placement or college-level courses in which students in your district were enrolled.*
- *Consider only credit-granting courses. Do not take into account supplemental course materials, virtual field trips, online homework, staff professional development, or courses conducted mainly via written correspondence.*

2. In 2002–03 (12-month school year), were any public elementary or secondary school students in your district enrolled in distance education courses **(as defined on the front of this questionnaire and in the box above)**?

Yes..... 1 (Continue with question 3.) No 2 (Stop. Complete respondent section on front and return questionnaire.)

3. Of the schools reported in question 1, how many had **at least one** student enrolled in distance education courses in 2002–03 (12-month school year)? *See box above for instructions. Enter “0” if there were no schools with students enrolled in distance education courses in your district at that instructional level in 2002–03.*

- a. **Total number of schools with students enrolled in distance education courses** _____
- b. Number of elementary schools with students enrolled in distance education courses..... _____
- c. Number of middle or junior high schools with students enrolled in distance education courses..... _____
- d. Number of high schools with students enrolled in distance education courses..... _____
- e. Number of combined or ungraded schools with students enrolled in distance education courses _____

4. For 2002–03 (12-month school year), report the number of **enrollments** in distance education courses of students regularly enrolled in your district. *See box above for instructions. Enter “0” if there were no students in your district enrolled in distance education courses at that instructional level in 2002–03.*

- a. **Total number of distance education course enrollments** _____
- b. Number of distance education course enrollments in elementary schools..... _____
- c. Number of distance education course enrollments in middle or junior high schools _____
- d. Number of distance education course enrollments in high schools..... _____
- e. Number of distance education course enrollments in combined or ungraded schools..... _____

5. For 2002–03 (12-month school year), report the number of **enrollments** in distance education courses by curriculum area of students who were regularly enrolled in your district. See box on previous page for instructions. Enter “0” if there were no students in your district enrolled in distance education courses in that curriculum area in 2002–03.

a. General elementary school curriculum	_____
b. English/language arts	_____
c. Social studies/social sciences (including history)	_____
d. Computer science	_____
e. Natural/physical science (e.g., biology, chemistry, physics)	_____
f. Mathematics	_____
g. Foreign languages	_____
h. Other (specify)	_____
i. Total number of enrollments across curriculum areas (Total should equal total in question 4a.)	_____

6. In 2002–03 (12-month school year), were any students regularly enrolled in your district enrolled in Advanced Placement or college-level courses offered through distance education? See box on previous page for instructions.

Yes 1 (Number of enrollments: _____) No 2

7. In 2002–03 (12-month school year), which technologies were used as **primary** modes of instructional delivery for **any** distance education courses in which students in your district were enrolled? (Circle one on each line.)

- If a course used multiple technologies to deliver instruction, but one mode predominated, circle yes for the predominant mode for the course.
- Please take into account any distance education courses in which students in your district were enrolled, regardless of where the courses originated.
- Do not consider technologies used for supplemental course materials or professional development.

	Yes	No
a. Internet courses using synchronous (i.e., simultaneous or “real time”) computer-based instruction (e.g., interactive computer conferencing)	1	2
b. Internet courses using asynchronous (i.e., not simultaneous) computer-based instruction	1	2
c. Two-way interactive video (i.e., two-way video with two-way audio)	1	2
d. One-way prerecorded video (including prerecorded videos provided to students, and television broadcast and cable transmission using prerecorded videos)	1	2
e. Other technologies (specify)	1	2

8. In 2002–03 (12-month school year), which **one** of the technologies listed in question 7 was used **for the greatest number** of distance education courses in which students in your district were enrolled? (Circle the letter corresponding to the technology listed in question 7. **Circle only one.**)

a b c d e

9. How important were the following reasons for having distance education courses in your district in 2002–03 (12-month school year)? Please take into account any distance education courses in which students in your district were enrolled, regardless of where the courses originated. (Circle one on each line.)

	Not important	Somewhat important	Very important	Don't know
a. Offering courses not otherwise available at the school	1	2	3	4
b. Offering Advanced Placement or college-level courses	1	2	3	4
c. Addressing growing populations and limited space	1	2	3	4
d. Reducing scheduling conflicts for students	1	2	3	4
e. Permitting students who failed a course to take it again	1	2	3	4
f. Meeting the needs of specific groups of students	1	2	3	4
g. Generating more district revenues	1	2	3	4
h. Other (specify)	—	2	3	—

10. In 2002–03 (12-month school year), which of the following entities **delivered** the distance education courses in which students in your district were enrolled? (*Circle one on each line.*)

	Yes	No	Don't know
a. Cyber (i.e., online) charter school in your district	1	2	3
b. Other schools in your district	1	2	3
c. Your district (i.e., delivered centrally from the district)	1	2	3
d. Another local school district, or schools in another district, in your state	1	2	3
e. Education service agencies within your state (e.g., BOCES, COE, IU), not including the state education agency or local school districts	1	2	3
f. State virtual school in your state (i.e., state-centralized K-12 courses available through Internet- or web-based methods)	1	2	3
g. State virtual school in another state	1	2	3
h. Districts or schools in other states (other than state virtual schools)	1	2	3
i. Postsecondary institution	1	2	3
j. Independent vendor	1	2	3
k. Other (<i>specify</i>)	1	2	3

11. In 2002–03 (12-month school year), were any students in your district enrolled in **online** distance education courses (i.e., courses delivered over the Internet)?

Yes 1 (*Continue with question 12.*) No 2 (*Skip to question 14.*)

12. In 2002–03 (12-month school year), where were students in your district accessing **online** distance education courses? *Please take into account any online distance education courses in which students in your district were enrolled, regardless of where the courses originated.* (*Circle one on each line.*)

	Yes	No
a. At school	1	2
b. At home	1	2
c. At some other location (<i>specify</i>)	1	2

13. In 2002–03 (12-month school year), did your district **provide or pay** for the following items for students accessing online distance education courses from home? (*Circle one on each line.*)

If no online distance education courses were accessed at home, check here ☐ and skip to question 14.

	Yes, for all students	Yes, for some students	No
a. Computer	1	2	3
b. Internet service provider	1	2	3
c. Other (<i>specify</i>)	1	2	3

14. In 2002–03 (12-month school year), did your district (or schools in your district) deliver any distance education courses to students who were **not** regularly enrolled in your district (e.g., to students from other districts, private school students, or home-schooled students)?

Yes 1 No 2 Don't know 3

15. Does your district plan to expand distance education courses?

Yes 1 (*Continue with question 16.*) No 2 (*Stop. Complete respondent section on front and return questionnaire.*)

16. To what extent are the following factors keeping your district (or schools in your district) from **expanding** distance education courses? (*Circle one on each line.*)

	Not at all	Minor extent	Moderate extent	Major extent
a. Course development and/or purchasing costs	1	2	3	4
b. Limited technological infrastructure to support distance education ...	1	2	3	4
c. Concerns about course quality	1	2	3	4
d. Restrictive federal, state, or local laws or policies	1	2	3	4
e. Concerns about receiving funding based on student attendance for distance education courses	1	2	3	4
f. Other (<i>specify</i>)	—	2	3	4
