The National Center for Education Statistics (**NCES**) is the primary federal entity for **collecting, analyzing, and reporting data related** to education in the United States and other **nations**. it fulfills a congressional mandate to **collect, collate, analyze,** and report full and complete statistics on the condition of education in the United **States**; conduct and publish reports and specialized analyses of the meaning and significance of such **statistics**; assist state and local education agencies in improving their statistical **systems**; and review and report on education activities in foreign **countries**.

NCES activities are designed to address high priority education data **needs**; provide **consistent, reliable, complete,** and accurate indicators of education status and **trends**; and report **timely, useful,** and high quality data to the **U.S. Department of Education, the Congress, the states,** other education **policymakers, practitioners, data users,** and the general **public**.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of **audiences**. **You,** as our **customer,** are the best judge of our success in communicating information **effectively**. If you have any comments or suggestions about this or any other **NCES** product or **report,** we would like to hear from **you**. Please direct your comments to:

Highlights

Low Income Undergraduates

- Overall, 20 percent of all undergraduates enrolled in 1992–93 were low income (that is, their family income was below 125 percent of the federally established poverty threshold for their family size) (table 1). From 17 percent to 19 percent of all undergraduates at public and private, not-for-profit 4-year institutions and at public less-than-4-year institutions were low income. In contrast, 42 percent of all undergraduates at private, for-profit institutions were low income.
- Low income undergraduates were about as likely as other undergraduates to enroll in public 4-year institutions (29 percent and 31 percent, respectively) and private, not-for-profit 4-year institutions (13 percent and 15 percent, respectively) (table 3). However, low income undergraduates were much more likely than other undergraduates to enroll in private, for-profit institutions (16 percent versus 6 percent), and were somewhat less likely to attend public less-than-4-year institutions (39 percent versus 47 percent).
- In 1989–90, 76 percent of low income undergraduates reported that the fact that an institution offered the course of study they wanted was a very important consideration in their choice of institution (table 4). They cited this factor far more frequently than any other. However, financial factors were important as well. Forty-five percent of low income undergraduates reported that obtaining the financial aid they needed was a very important consideration (compared with 20 percent of other undergraduates).

Educational Costs and Financial Need

- The average budget for low income undergraduates who attended full time, full year ranged from \$8,100 at public less-than-4-year institutions to \$15,500 at private, not-for-profit 4-year institutions (table 7). The average expected family contribution (EFC) was \$1,600.
- Ninety-nine percent of all low income undergraduates had financial need (table 7). The average need (budget minus EFC)

was \$9,400. Average need ranged from \$7,000 at public less-than-4-year institutions to \$13,600 at private, not-for-profit 4-year institutions.

Financial Aid

- In 1992–93, 88 percent of all low income undergraduates attending full time, full year received some type of financial aid (table 8). The average amount received was \$5,800. Eighty-four percent received grants, 48 percent borrowed through student loan programs, and 15 percent participated in work-study programs. Eighty-three percent received some type of federal aid (table 9).
- On average, financial aid covered 42 percent of student-reported costs for low income undergraduates attending full time, full year; 65 percent of their aid was in the form of grants, and 26 percent was in the form of loans (table 12).

Net Cost and Unmet Need

- The average net cost (student-reported cost minus financial aid) for the low income full-time, full-year undergraduate and his or her family was \$7,600 (table 13).
- Their average unmet need (institutionally determined budget minus financial aid minus EFC) was \$4,900 (table 13).

Other Sources of Support

- Low income, financially dependent undergraduates attending full time, full year were less likely than their non low income counterparts to receive direct contributions from their parents (50 percent versus 78 percent) (tables 15 and 16). Low income dependent undergraduates who did get help from their parents received an average of \$2,800, compared with \$5,600 for non low income undergraduates.
- Among full-time, full-year low income undergraduates who worked while enrolled, the average was about 22 hours per week. Those who worked earned an average of \$4,200 during the 1992–93 academic year (including summer 1992). Compared with their non low income counterparts, low income undergraduates attending full time, full year were less likely to work while enrolled (63 percent versus 77 percent) and were more likely to borrow (48 percent versus 30 percent) (tables 15 and 16).

Foreword

This report describes how low income undergraduates—that is, undergraduates whose family income was below 125 percent of the federally established poverty threshold for their family size—finance their postsecondary education. It examines dependent, single independent, and independent students with dependents separately. First, the report describes the demographic characteristics and enrollment patterns of low income students and compares them with other undergraduates. It then examines their financial need, the kinds and amounts of financial aid they received, and the relationship between financial aid and cost. Next, it describes two important sources of support other than financial aid: parental support and work. Finally, the report examines persistence and attainment among low income students who enrolled in postsecondary education for the first time in 1989–90.

The report uses data primarily from the 1992–93 National Postsecondary Student Aid Study (NPSAS:93), a survey designed to answer fundamental questions about financial aid and to detail undergraduates' education expenses, sources, and types of financial aid. The report also uses data from NPSAS:90 and the Beginning Postsecondary Student Longitudinal Study (BPS: 90/94), which followed a sample of students identified in NPSAS:90 as first-time beginning postsecondary students in the 1989–90 academic year.

The estimates in this report were produced using the National Center for Education Statistics (NCES) Data Analysis System (DAS), a software application that allows users to specify and generate tables from NPSAS and BPS data files. Each estimate produced in a table is accompanied by the standard error and weighted sample size on which the estimate was based. The DAS is available to anyone interested in further exploring the NPSAS or BPS (see appendix B for a more detailed discussion and directions for obtaining a copy).

We hope that readers of this report will find it informative and useful. We welcome recommendations for improving the format, content, or analysis to make subsequent reports even more informative and accessible.

John H. Ralph
Acting Associate Commissioner
Data Development and Longitudinal Studies Division

Acknowledgments

The authors wish to thank all who contributed to the production of this report. At MPR Associates, special thanks go to Lutz Berkner and Laura Horn for their technical guidance and helpful comments throughout this study. Andrea Livingston edited the report, Mary Sukkestad formatted the tables, Lynn Sally prepared the graphics, and Don Eike formatted and assembled the final version.

We would also like to acknowledge the careful review and thoughtful comments of the following reviewers: Dennis Carroll, Mary Frase, Robert Burton, Sal Corrallo, and Linda Zimble at NCES; Jacqueline King from the College Board; and Kent Phillippe from the American Association of Community Colleges (AACC).

Introduction

For students considering pursuing a postsecondary degree or certificate, one of the most critical deciding factors is their ability to marshal the necessary financial resources. Paying for undergraduate education has always been seen as primarily the family's responsibility to the extent they can afford to do so. Tapping their own resources, students and their families use current income, savings, and borrowing against assets. Students sometimes work while still in high school to earn money for college, and the majority work while enrolled in postsecondary education.¹ Parents may start saving for their children's education many years before the child enrolls. Sometimes they take an additional job or borrow against assets such as a house. Low income families rarely have substantial savings to draw upon or assets to borrow against, and are unlikely to have very much discretionary income after paying for housing, food, clothing, and other basic necessities. In short, without financial assistance, postsecondary education would be out of reach for most low income students.

The federal government has established a broad range of student financial aid programs to provide low income students with the opportunity to participate in postsecondary education. Some of this aid has been in the form of grants, and some in the form of loans and work study. States and institutions do their part, too. Many states provide substantial funding for postsecondary institutions, allowing them to keep tuition well below the actual cost of educating a student, and some have their own student financial aid programs as well. Institutions and other organizations have also helped by providing large amounts of need-based aid. In 1992-93, the federal government awarded \$23.4 billion dollars in general aid to postsecondary students; states, \$2.1 billion; and institutions and other organizations, \$7.3 billion.²

This report examines how low income students pay for their postsecondary education, focusing on the importance of financial aid. The report begins by describing the demographic and enrollment characteristics of low income undergraduates and by comparing their characteristics to those of other undergraduates. It then examines low income students' educational costs, financial need, and their

¹See Laura Horn, *Undergraduates Who Work While Enrolled in Postsecondary Education: 1989-90* (Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, 1994), NCES 94-311, for a description of how much undergraduates work while enrolled.

²The College Board, Washington Office, *Trends in Student Aid: 1984 to 1994* (Washington, D.C.: 1994),4.

use of financial aid and other sources of financial support. Finally, it compares the persistence and attainment of low income and other students.

The primary source of data for the analysis was the 1992–93 National Postsecondary Student Aid Study (NPSAS: 93). These data are supplemented with data from two other postsecondary education surveys: NPSAS: 90 for information not available from NPSAS: 93 on students' reasons for choosing institutions; and the Beginning Postsecondary Students

Longitudinal Study (BPS: 90/94) for information on persistence and attainment for NPSAS: 90 students who began their postsecondary education in 1989–90.³

Definition of “Low Income”

For this analysis, “low income” undergraduates are defined as students with a family income below 125 percent of the federally established poverty threshold for their family size.⁴ For 1991, the poverty thresholds and 125 percent of these levels were as follows:⁵

<i>Family size</i>	<i>Poverty threshold</i>	<i>125 percent of the poverty threshold</i>
1	\$7,086	\$8,858
2	9,165	11,456
3	10,860	13,575
4	13,924	17,405
5	16,456	20,570
6	18,587	23,234

This definition has several advantages. First, it is independent of who goes to college. In other words, the low income students in this analysis are poor relative to the general population, rather than just the lowest income students who enroll in postsecondary education. Second, the federal poverty levels are stated in terms of both income and family size, allowing for appropriate comparisons between single students and students in larger families. Third, the poverty levels are adjusted for inflation and updated annually, permitting meaningful comparisons over time.

The decision to use 125 percent of the poverty threshold as the cutoff for this study was partly practical, reflecting a desire not to go too far above the poverty level, but at the same time to get a large enough sample to be able to find differences among subgroups. It is worth noting that 125 percent is also a commonly used cutoff point for reporting on low income families (see the *Statistical Abstract of the United States*, for example).

³See appendix B for more information on NPSAS and BPS.

⁴Income is defined as the sum of adjusted gross income and untaxed income.

⁵U.S. Department of Commerce, Bureau of the Census, *Statistical Abstract of the United States: 1994* (Washington, D.C.: 1994), 480. The 1991 income was used to determine a student’s eligibility for financial aid in 1992–93.

Overall, 20 percent of all undergraduates enrolled in 1992–93 were low income according to this definition (table 1). Low income students made up roughly similar proportions of the total student population at public less-than-4-year and 4-year institutions, and at private, not-for-profit 4-year institutions (17 percent to 19 percent) (figure 1). Private, for-profit institutions, in contrast, had a much larger concentration of low income students (42 percent). However, relatively few students (only 8 percent of all undergraduates) enrolled in this type of institution (see table 3).

Table 1—Percentage distribution of undergraduates according to income status, by selected student and institutional characteristics: 1992–93

	Low income	Not low income

Figure 1—Percentage of undergraduates who were low income, by type of institution: 1992–93

SOURCE: U. S. Department of Education, National Center for Education Statistics, 1992–93 National Postsecondary Student Aid Study (NPSAS: 93), Undergraduate Data Analysis System.

Certain groups were particularly likely to be in the low income category, most notably minorities and single parents (table 1). In 1993–94, about one-third of black, non-Hispanic, Hispanic, and Native American undergraduates and more than half (57 percent) of single parent undergraduates were low income. In contrast, 17 percent of white, non-Hispanic undergraduates and 17 percent of undergraduates who were not single parents were low income.

Income and Dependency Status

Although the definition of low income used in this analysis has no connection to the financial aid system, it is important to understand that whether or not a student was categorized as low income was related to the student’s dependency status for financial aid purposes. Whose income is counted in the calculation of the student’s family income varies with dependency status. From a financial aid perspective, there are three quite distinct groups of undergraduates:

1) *Dependent students (48 percent of all undergraduates)*

Undergraduates less than 24 years old are considered dependent for financial aid purposes unless they meet one of the criteria for independence described below, which

relatively few do. The vast majority (87 percent) of undergraduates less than 24 years of age were considered financially dependent in 1992–93 (table 2).

Under current financial aid policy, the parents of dependent students are expected to pay for their children’s education to the extent they can afford to do so. Therefore, dependent students’ eligibility for financial aid takes into account parents’ incomes and other aspects of their financial circumstances whether or not the parents actually contribute.

For this analysis, dependent students who came from 4-person families were defined as low income if their parents’ income was less than \$17,405. The level was lower if the family was smaller and higher if the family was larger. In 1992–93, 12 percent of all dependent undergraduates were from low income families (table 1).

Table 2—Percentage distribution of undergraduates according to dependency status, age, and marital status, by income and dependency status: 1992–93

Independent dependents	All students	Not low income	Total	Low income		
				Dependent	Single independent	with dependents
Total	100.0	100.0	100.0	100.0	100.0	100.0

Married	25.5	27.6	17.8	2.3	(*)	40.7

*Not applicable.

NOTE: Percentages may not sum to 100 due to rounding. Percentages for “all students” include students with missing income data. Therefore, the percentages for all students may be higher or lower than the percentages for low income and not low income students. For example, the percentage of all students less than 24 years old (55.1 percent) is greater than the percentages for both low income students (50.1 percent) and not low income students (54.5 percent).

**SOURCE: U. S. Department of Education, National Center for Education Statistics, 1992-93
National Postsecondary Student Aid Study (NPSAS: 93), Undergraduate Data Analysis System.**

2) Single independent students⁶ (20 percent of all undergraduates)

Undergraduates 24 years or older are considered financially independent of their parents for financial aid purposes, regardless of their parents' incomes and whether or not their parents provide them with any financial assistance. In 1992–93, about two-thirds of single independents were at least 24 years old and therefore were considered independent simply because of their age (table 2). For single independent students, “family income” includes only the student's income.

Undergraduates less than 24 years old were considered financially independent of their parents if they were not claimed as a tax exemption by their parents for the 2 years before the beginning of the academic year for which they were applying for financial aid and had at least \$4,000 in financial resources; if they were military veterans; if they were wards of the court; or if both parents were deceased and they had no legal guardian.⁷ In 1992–93, only 6 percent of all undergraduates less than 24 years old met one of these criteria.

About one-third (31 percent) of all single independents were defined as low income for this analysis (that is, they had incomes of less than \$8,858) (table 1). Some of these students may have had low incomes temporarily because they were enrolled in postsecondary education and not working or only working a limited amount. Others may have had low incomes on a longer term basis because they had difficulty finding steady work or a well-paying job (they might have been returning for further education to improve their employment prospects). Low income single independents may or may not have come from disadvantaged backgrounds; their parents' incomes were not considered in assessing their need for financial aid.

3) Independent students with dependents (32 percent of all undergraduates)

Undergraduates with dependents of their own are considered financially independent of their parents regardless of their age.

⁶“Single independent” students are more precisely “independents without dependents,” and therefore could include students who are married but separated and therefore technically not “single.” However, the term “single independents” is used in this report because it is less cumbersome and easier to distinguish from “independents with dependents.”

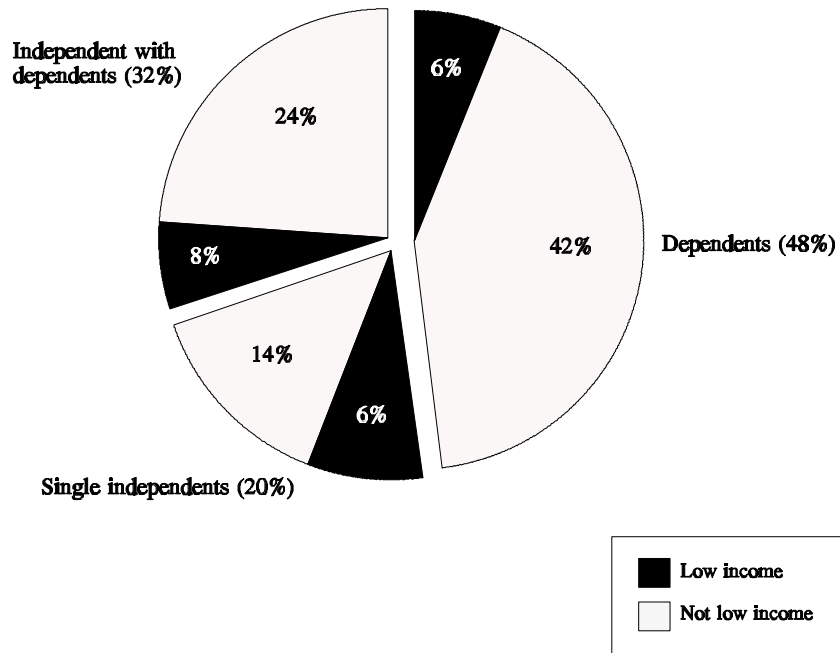

⁷The Higher Education Amendments of 1992 changed the definition of independent, making it more difficult for students less than 24 years old to file financial aid applications as independents. Starting in 1993–94, it was no longer possible for students to apply for financial aid as independents on the grounds they were not claimed as tax exemptions for 2 years and could document resources of more than \$4,000 per year.

Spouses count as dependents except in the rare instance where a student is married and still claimed as a tax exemption by his or her parents; in such cases, the student would still be considered dependent. In 1992–93, 32 percent of all undergraduates and 8 percent of undergraduates under 24 years of age were independents with dependents (table 2). For purposes of determining eligibility for financial aid, a married independent student's family income includes the student's and his or her spouse's income.

Twenty-six percent of all independents with dependents were in the low income category (table 1). This group includes a relatively large number of single parents (59 percent of low income independents with dependents were not married or were separated) (table 2). Also likely to be in the group of low income independents with dependents are married students with spouses who were also students and married students with children whose spouses worked only part time or not at all.

To summarize, figure 2 shows the distribution of the entire undergraduate population by income and dependency status in 1992–93. Almost half (48 percent) of all undergraduates were dependent. However, relatively few of them came from low income families. Larger proportions of single independents and independents with dependents were low income. Because spouses are considered dependents for financial aid purposes, many students in the "independents with dependents" category have a spouse who works. Thus, it is not surprising that a greater proportion of single independents, who have only their own incomes to rely upon, would be in the low income category.

Figure 2—Percentage distribution of undergraduates by income and dependency status: 1992–93

SOURCE: U. S. Department of Education, National Center for Education Statistics, 1992-93 National Postsecondary Student Aid Study (NPSAS: 93), Undergraduate Data Analysis System.

Comparison With Other Students

Demographic Characteristics

As a group, low income students were much more likely than other undergraduates to be minority (36 percent compared with 21 percent) (figure 3 and table 3).⁸ Within the low income student population, dependent students were more likely than either type of independent student to belong to a minority group. Among dependent students, 20 percent were Hispanic; 19 percent were black, non-Hispanic; 8 percent were Asian/Pacific Islander; and 1 percent were American Indian/Alaskan Native.

Low income undergraduates also tended to have less well-educated parents than other students. More than one-half (54 percent) of low income undergraduates had parents with only a high school education or less, compared with 43 percent of other undergraduates (figure 4). Because of the close relationship between income and education, it is not surprising that dependent students from low income families had parents with relatively low educational attainment (57 percent had only a high school education or less). Among low income students, single independents had the best educated parents: 45 percent had parents

Figure 3—Percentage distribution of undergraduates according to race-ethnicity, by income and dependency status: 1992-93

⁸As shown in figure 3 and table 3, 64 percent of low income students and 79 percent of other students were white, non-Hispanic, leaving 36 percent and 21 percent, respectively, minority.

with a high school education or less, a proportion similar to that of undergraduates who were not low income. As indicated earlier, low income single independents may be poor because they are students, but they do not necessarily come from disadvantaged backgrounds. Low income independents with dependents tended to have less well-educated parents than single independents (59 percent had parents with only a high school education) (table 3). They may have been more likely to come from disadvantaged backgrounds, but another possible explanation or contributing factor may be that low income independents with dependents were more likely than low income single independents to be 30 years or older (table 2), increasing the likelihood that their parents belonged to a generation less likely to have attended college.

Enrollment Patterns

Low income undergraduates were about as likely as other undergraduates to enroll in public 4-year institutions (29 percent and 31 percent, respectively) and private, not-for-profit 4-year institutions (13 percent and 15 percent, respectively) (figure 5 and table 3). However, low income students were much more likely than other students to enroll in private, for-profit institutions, and were somewhat less likely to attend public less-than-4-year institutions.

Low income undergraduates were more likely than other undergraduates to enroll full time in their first term in 1992–93 and to enroll full time for only part of the year. This pattern reflects, in part, low income students' greater numbers at private, for-profit institutions, which tend to have shorter, full-time programs. However, greater full-time

Figure 4—Percentage distribution of undergraduates according to parents' education, by income and dependency status: 1992–93

SOURCE: U. S. Department of Education, National Center for Education Statistics, 1992–93 National Postsecondary Student Aid Study (NPSAS: 93), Undergraduate Data Analysis System.

attendance may also reflect the fact that, for independent students, attending full time makes it more likely their income will be low because they have less time to work.

Low income students differed from their non low income counterparts in their choice of degree program, with low income students being more likely to enroll in a certificate program and less likely to enroll in a bachelor's degree program. However, despite the differences in where they enrolled and their immediate academic goals, low income and other undergraduates had similar long-term academic goals, with similar proportions in each group aspiring eventually to associate's, bachelor's, and advanced degrees.

Figure 5—Percentage distribution of undergraduates according to type of institution, by income and dependency status: 1992–93

Considerations in Choosing an Institution

In 1989–90, 76 percent of low income undergraduates reported that the fact that an institution offered the course of study they wanted was a very important consideration in their choice of institution.⁹ They cited this factor far more frequently than any other (table 4). However, financial considerations were important as well. Forty-five percent of low income students reported that obtaining the financial aid they needed was a very important consideration (compared with only 20 percent of other students). Low income students were also more likely than other students to report that other factors that had financial implications (lower tuition and other expenses, a good reputation for placement, and being able to finish in a shorter time) were very important.

Although students were not asked in NPSAS:93 why they chose the institution in which they enrolled, there is some evidence of efforts on the part of low income students to try to reduce costs. For example, low income students at 4-year institutions were more likely

than other undergraduates (24 percent compared with 20 percent) to live with their parents or relatives. This can be an important strategy for reducing housing and, possibly, transportation costs (table 5). Based on tuition and fees paid by students who attended full time, full year, low income undergraduates appear to be sensitive to tuition charges. Except at public less-than-4-year institutions, low income undergraduates enrolled full time, full year paid a lower average amount for tuition and fees than their counterparts who were not low income at the same type of institution (table 6). This suggests that low income students may be choosing lower cost rather than high-cost private institutions and less expensive public institutions over more expensive ones as a way of keeping down their educational costs.

Financial Need

Method for Assessing Financial Need

To assess a student's need for financial aid, a financial aid officer starts by establishing an appropriate budget that takes into account direct educational expenses and reasonable living expenses. Direct educational expenses include tuition, fees, books, and supplies. Living expenses include room and board if living on campus, or rent and food if living off campus; personal expenses; transportation; and any special items a student requires, such as child care or special equipment needed because of a handicapping condition.

What the family is expected to pay is calculated using a formula that takes into account family income and assets, the size of the family, and the number of other family members enrolled in postsecondary education. This calculated amount becomes the "expected family contribution" (EFC) and is independent of where the student chooses to enroll. In other words, the EFC is the same regardless of whether the student chooses an institution with a tuition of \$1,500 or \$15,000. The student is eligible for the amount of financial aid needed to make up the difference between the EFC and the budget, although there is no guarantee that the financial aid funds will be available to meet the need fully.

Over the years, the methodology used to calculate the EFC has changed many times as policymakers have attempted to achieve both simplicity and fairness and to ration limited funds. Each adjustment to the formula has changed who is eligible for financial aid and how much. The debate over whose income and assets should be included and how they should be treated continues. Some issues that still exist include the age of the student at which the parents' income should no longer count; how a noncustodial parent's or stepparent's income should be treated when parents are divorced; what assets should be sheltered; what percentage of their assets parents should be expected to contribute; and how much the student should be expected to earn.¹⁰

In 1992–93, there were minimum EFCs (although these have since been eliminated). The minimum EFC for dependent students was \$700 for the first year and \$900 afterwards; for single independent students,

¹⁰For comments on the current state of need analysis, see National Association of Student Financial Administrators, *Need Analysis: Does it Still Work?* (Washington, D.C.), June 1995.

it was \$1,200. There was no minimum EFC for independent students with dependents.

Figures 6–8 show the relationship between the average budgets for full-time, full-year students at various types of institutions and the average EFCs at each income level in 1992–93. The difference between the budgets and the EFCs was the average amount of financial aid for which students were eligible at each income level.

On average, families with incomes under \$50,000 would have been eligible for some financial aid to support a dependent full-time, full-year undergraduate at an average-cost postsecondary institution of any type in 1992-93 (figure 6). With higher incomes, families were eligible for financial aid only at the more costly institutions. Full-time, full-year single independent students with incomes under about \$20,000 would have been eligible for some financial aid at an average-cost postsecondary institution of any type (figure 7). Independent students with dependents of their own had the lowest EFCs, on average, because they had no minimum EFC. With incomes under \$50,000 they would have been eligible for financial aid to meet the average costs of attending any type of institution full time, full year (figure 8).

The discussion of costs and financial aid that follows is limited to low income students who attended full time, full year because of the difficulty of making comparisons among students whose attendance patterns vary as widely as those in the group of students who attend part time and/or part year. Forty-four percent of low income dependent students attended full time, full year, as did 38 percent of low income single independents and 27 percent of independents with dependents (table 3). The discussion is also limited to undergraduates who attended only one institution, because of the need to have a consistent picture of aid and costs. One percent of all full-time, full-year undergraduates attended more than one institution during the 1992-93 academic year.¹¹

Budgets and Costs

Turning specifically to low income students attending full time, full year, average budgets ranged from \$8,100 at public less-than-4-year institutions to \$15,500 at private, not-for-profit 4-year institutions (table 7).¹² For dependent full-time, full-year low income students, the average budget was about the same as the average student-reported costs at each type of institution, but for their independent counterparts (both single independents and

¹²It should be pointed out that only 30 percent of low income students attending private, for-profit institutions were enrolled full time for a full year; most were enrolled in programs lasting less than 1 year. Thus, the majority of students at private, for-profit institutions would not be paying tuition as high as \$13,000 for their programs. U.S. Department of Education, National Center for Education Statistics, 1992–93 National Postsecondary Student Aid Study (NPSAS:93), Data Analysis System.

independents with dependents), the average student-reported cost tended to be higher than the average budget.¹³

¹³All differences for independent students were statistically significant except for single independent students at private, for-profit institutions.

Expected Family Contributions

The average EFC for low income students who attended full time, full year was \$1,600 in 1992–93 (table 7). Because the EFC is independent of the cost of attending, the differences in average EFCs across institution types reflect the differences in the income, family size, and dependency status of the students who attended each type of institution.¹⁴ Among low income students attending full time, full year, the average EFC was greatest (\$2,500) for single independent students, who are expected to contribute a substantial part of their income and savings to supporting their educational costs. The average EFCs for dependent students and independent students with dependents were about \$1,900 and \$300, respectively.

Financial Need

A student's need for financial aid is the difference between the institutionally determined budget for the student and the student's EFC. Virtually all low income students enrolling full time, full year (99 percent) had financial need in 1992–93 (table 7). The average need (including the few with zero need) was \$9,400. As would be expected given cost differences, the average need for low income students varied by type of institution, ranging from \$7,000 at public less-than-4-year institutions to \$13,600 at private, not-for-profit 4-year institutions.

Among low income undergraduates enrolling full time, full year, dependent and single independent students had similar financial need, on average (\$9,300 and \$8,800, respectively). The average financial need of independent students with dependents was somewhat greater (\$10,200). This reflects the fact that they had no minimum EFC and may also be related to the types of institutions they attended. Independents with dependents had a greater propensity than other students to attend the higher cost private, for-profit institutions; however, they were also more likely to attend the less costly public, less-than-4-year institutions (see table 3).

¹⁴Dependency status is relevant because dependents, single independents, and independents with dependents have different minimum contributions and are subject to different rules about how their income and assets are treated.

Financial Aid

The vast majority (88 percent) of low income students who enrolled full time, full year in 1992–93 received some type of financial aid (table 8). The average amount aided students received varied by institution type, ranging from \$3,400 at public less-than-4-year institutions to \$9,300 at private, not-for-profit 4-year institutions.

Types of Aid

Grants are the foundation of student financial aid for low income students. Depending on the type of institution, between 80 percent and 95 percent of full-time, full-year low income students received grants (figure 9 and table 8). The average amount received in the

form of grants was in the \$2, 300–\$3, 300 range except at private, not-for-profit 4-year institutions, where it was \$6, 000 (table 8).

Loans were used less frequently, with 48 percent of low income students borrowing. Students at public less-than-4-year institutions were the least likely to borrow (20 percent). Between 40 percent and 62 percent borrowed in other types of institutions. The average loan ranged from \$2, 500 to \$3, 900, depending on the type of institution. The differences reflect, at least in part, higher borrowing limits for upper-division students as well as cost differences among institution types.

Work-study aid was far more common at private, not-for-profit 4-year institutions than at other types of institutions. Thirty percent of full-time, full-year low income undergraduates participated in work study in that type of institution in contrast to 15 percent or less at other types of institutions. However, the average amount earned by participants was roughly similar at each type of institution (\$1, 300 to \$1, 600).

Receipt of some types of aid varied by dependency status. Similar percentages of dependents, single independents, and independents with dependents received grants, but single independents were more likely than independents with dependents to borrow. Dependent students were more likely than either type of independent student to participate in work-study programs.

Sources of Aid

The federal government was the major source of all types of financial aid. With respect to grants, the Pell grant program was the most important. Overall, 84 percent of full-time, full-year low income undergraduates received some type of grant aid; 78 percent received federal grant aid; and 76 percent received a Pell grant (tables 8, 9, and 10). The average Pell grant was \$2, 100 (table 10), just \$300 less than the 1992–93 maximum allowable award of \$2, 400.¹⁵

Full-time, full-year low income students at private, not-for-profit 4-year institutions received larger amounts of federal grant aid (\$2, 800, on average) than their counterparts at other types of institutions. This was partly due to slightly larger Pell amounts, but also because they were considerably more likely than their

¹⁵The maximum Pell grant was also limited by educational costs. Students at low-tuition public institutions were not always eligible for the maximum \$2,400.

counterparts in other types of institutions to receive Supplementary Education Opportunity Grants (SEOGs) (table 10).¹⁶

Participation in loan programs varied considerably by type of institution. However, at each type of institution, almost all of the students with loans had federal loans, and most of these students had Stafford loans (tables 8, 9, and 11). About one out of five full-time,

¹⁶The difference in the average Pell grant at private, not-for-profit 4-year and less-than-4-year institutions was not statistically significant.

full-year low income students at private, not-for-profit 4-year institutions took out a Perkins loan, a much greater proportion than at any other type of institution (table 10).

It should be noted that students' access to federal campus-based aid (SEOG, Perkins, and College Work-Study programs) varies from one institution to another for reasons other than student financial need. The allocation of campus-based aid to institutions has a historical basis. Not all institutions participate, and institutions have different amounts to distribute. Older institutions that have been participating for a long time have the largest amounts.

State aid (which is primarily grant aid) was another important source of aid for low income students, with 34 percent of those who attended full time, full year receiving an average of \$1,600 (table 9). State aid was less available to those at private, for-profit institutions than at other types of institutions (10 percent received state aid compared with one-third or more elsewhere). Many state programs do not provide awards to students in private, for-profit institutions.

Institutional aid was an important source of aid for full-time, full-year low income students at private, not-for-profit 4-year institutions: 52 percent received institutional aid averaging \$4,600 (table 9). Their counterparts at other types of institutions were much less likely to receive this type of aid. Public institutions usually have relatively little need-based aid to distribute. In many states, most need-based aid at public institutions is awarded directly to students through state grant programs rather than through the institutions.

Relationship Between Financial Aid and Cost

Ratio of Financial Aid to Total Cost

On average, financial aid covered 42 percent of the student-reported cost of attending for low income undergraduates enrolling full time, full year in 1992–93 (table 12).¹⁷ Sixty-five percent of their aid was in the form of grants, and 26 percent in the form of loans.

The different ratios across institution types reflect in part differences in the cost of attending. Pell grants are normally awarded to financially needy students first, with other grants, loans, and work-study aid added where unmet need still exists. For example, the average ratio of loans to total aid was 11 percent at public less-than-4-year institutions, but 32 percent at public 4-year institutions, where average costs were higher (see table 7).

Overall, the federal government was the source of most financial aid (77 percent, on average). State aid programs added another 10 percent, and institutional aid programs, 9 percent. Differences in these ratios across institution types reflect the availability of various sources of aid at different types of institutions. For example, the relative unavailability of state and institutional aid at private, for-profit institutions increased students' reliance on federal aid. On average, 93 percent of the aid to full-time, full-year low income students at private, for-profit institutions came from federal sources, compared with 65 percent to 81 percent at other types of institutions (figure 10).

Institutional aid accounted for an average of 21 percent of all aid to students in private, not-for-profit 4-year institutions who received aid. However, institutional sources were relatively unimportant in other types of institutions: 9 percent in public 4-year institutions and even less elsewhere.

Net Cost and Unmet Need

The net cost to the student is the amount left after subtracting the total amount of financial aid (grants, loans, and work study) from the total student-reported cost. In 1992–93, full-time, full-year low income undergraduates had an average net cost of \$7,600, ranging from \$6,500 at public 4-year to \$9,700 at private, for-profit institutions (figure 11 and table 13). While financial aid does not equalize educational costs across types of institutions, it does have an impact on the relative costs of attending some types of institutions. For example, while the average total cost of attending a public less-than-4-year

¹⁷This includes students without aid. Because 99 percent of all full-time, full-year low income students had financial need and thus would have been eligible for financial aid, it seemed more appropriate to include all of them in the calculation of the ratios in this table, rather than to limit the calculation to just those who received aid.

institution was less than the average total cost of attending a public 4-year institution (\$10,100 compared with \$11,400, table 7), the average net cost was not less (\$7,300 compared with \$6,500, table 13).

Financial aid reduced educational costs for full-time, full-year low income students. Nevertheless, a substantial gap remained between their average net cost of \$7,600 and their average EFC of \$1,600.

Unmet need, for financial aid purposes, is what remains after subtracting financial aid and the EFC from the budget established by the institution (not student-reported costs). In 1992–93, 94 percent of all full-time, full-year low income students had unmet need (table 13). The overall average unmet need (including students with zero need) was \$4,900, and ranged from \$3,700 at public 4-year institutions to \$8,100 at private, for-profit institutions.¹⁸ Independents with dependents had the greatest unmet need at each type of institution, reflecting their lower EFCs and partially reflecting the maximum award limits in grant and loan programs.

¹⁸The average unmet need was somewhat lower than the gap between net costs and the EFC. This can be explained by the fact that unmet need is calculated with reference to the institutionally determined budget (which averaged \$10,900, table 7), while net costs are calculated with reference to student-reported costs (which averaged \$12,600).

In part, the unmet need also reflects an apparent reluctance of low income students to borrow. Despite their unmet need, full-time, full-year low income students did not always

borrow as much as they could have through the Stafford loan program (table 14). A full 64 percent of those with \$2,000 or more in unmet need did not take out a Stafford loan, and another 15 percent borrowed less than the maximum. Those with the lowest net costs and lowest unmet need (less than \$1,000) were more likely than those with net costs or unmet need greater than \$2,000 to have borrowed the maximum. This pattern is expected, because borrowing contributed to reducing their need and net cost.

Sources of Support Other Than Financial Aid

Although the federal and state governments, postsecondary institutions, and other organizations provide substantial amounts of student financial aid, the net cost to full-time, full-year low income undergraduates and their families was \$6,500 to \$10,000 in 1992–93, depending on the type of institution attended (see table 13). These amounts are well beyond the EFCs.

Where do low income students obtain the funds they need to cover their educational costs? Because the NPSAS data provide only partial information on the financial circumstances of students and their families, this question cannot be answered with precision. However, NPSAS does provide some information on two of the most important sources of funds: parental support and student earnings.

Parental Support

The financial aid system has different expectations about parental support for dependent and independent students. Parents of dependent students are expected to help pay their children's educational costs, while there is no such expectation for parents of independent students. It is therefore appropriate to look at parental support separately for dependent and independent students.

Dependent Students

Low income families often have difficulty helping their children pay for their education. In 1992–93, 50 percent of low income dependent undergraduates who attended full time, full year received money from their parents. Among those who did, the average amount was \$2,800 (table 15). In contrast, 78 percent of the full-time, full-year dependent undergraduates who were not from low income families received money from their parents. They received an average of \$5,600, about twice as much as their low income counterparts (table 16).

Of particular interest is parental support to the low income dependent students who did not receive financial aid (although only 11 percent of full-time, full-year low income dependent undergraduates were in this position, table 8). The unaided students were much more likely than their aided counterparts to receive parental contributions (77 percent compared with 46 percent), and they received more, on average (\$6,000 compared with \$1,900) (table 15). This suggests that while the parents of low income dependent students without financial aid in 1992–93 had low incomes in 1991 (the reference year for determining income), they had other financial resources. For example, they may not have been low income on a long-term basis and may have been able to accumulate savings before 1991, or a noncustodial parent may have made a substantial contribution.

Nine percent of low income dependent undergraduates attending full time, full year received loans from their parents, averaging \$1,800 (table 15). A similar percentage (11 percent) of their non low income counterparts received loans from their parents (table 16), but the non low income students received more, on average (\$3,100 compared with \$1,800), reflecting their families' greater resources.

Parents often make non-cash contributions to their students' support in addition to or in place of direct financial assistance. For example, students may live at home while enrolled or during the summer, allowing them to reduce their housing costs and save money from summer jobs to cover educational expenses. Parents may offer a variety of other types of support, such as furniture, meals, clothing, or the use of a car, to name only a few. It is very difficult to attach a dollar value to this kind of assistance.

Independent Students

Although parents are not expected to help their independent children pay for their education, 39 percent of low income single independent undergraduates attending full time, full year received parental contributions averaging \$3,500 in 1992-93 (table 15). Their non low income counterparts were less likely to receive such help (31 percent) (table 16). This is not surprising, because the students who were not low income would have had less need for parental support. Low income independent students may or may not have low income parents. Whether or not their parents contribute is influenced by both their willingness to contribute and their financial ability to do so.

Parental contributions to independents with dependents followed a similar pattern, with low income students also being more likely to receive assistance. Twenty-one percent of low income students attending full time, full year received contributions from their parents, in contrast to 12 percent of their non low income counterparts (tables 15 and 16).

Work

The majority of full-time, full-year low income students worked in 1992-93: 63 percent worked while enrolled, and 68 percent worked at some point during the year (table 15). They were actually less likely than their non low income counterparts to work at some point during 1992-93 (tables 15 and 16). This was true for dependent students and independent students with dependents; single independent students were about equally likely to work whether or not they were low income.

While one might expect low income independent students attending full time, full year to be less likely than their non low income counterparts to work (not working makes them

more likely to have low incomes), it is not obvious why the same would be true for low income dependent students attending full time, full year. One possibility is that their family backgrounds give them less access to jobs. Among dependent students who worked while attending full time, full year, the average hours worked per week while enrolled were similar (about 20 hours) for low and non low income students, which suggests that scheduling demands may not be a factor.

SOURCE: U. S. Department of Education, National Center for Education Statistics, 1992–93 National Postsecondary Student Aid Study (NPSAS: 93), Undergraduate Data Analysis System.

Full-time, full-year low income students who were working while enrolled worked an average of 22 hours per week. They earned an average of \$4,200 during the year (including summer). Dependent students earned less, on average, than independent students (\$3,200 compared with \$4,600 for single independents and \$5,000 for independents with dependents). The lower earnings for dependent students may reflect their younger age. Average earnings for low income students enrolled full time, full year were less than those for their non low income counterparts, who earned an average of \$4,900.

Parental Contributions, Work, and Loans

Parental contributions, work, and loans are sometimes substituted for one another. If parents are unable or unwilling to contribute or if students do not want to accept parental help, the major alternatives are work and loans. The tradeoff between work and loans reflects borrowing limits set by loan programs, availability of jobs, time available to work, and students' willingness to go into debt.

Loans and Parental Contributions

Borrowing was associated with lower parent contributions for full-time, full-year low income students. Among dependent students, about one-half received parental contributions whether or not they borrowed, but students with loans received less from their parents, on average (\$3,600 compared with \$1,900) (table 15). Among independent students, those who borrowed were less likely than those who did not borrow to receive help from their parents, and if they did receive help, the average amount was less.

Loans and Work

Full-time, full-year low income students who borrowed were more likely than students who did not borrow to work, perhaps reflecting their greater need for funds.¹⁹ However, the amount of time worked while enrolled was about the same whether students borrowed or not: among low income students who attended full time, full year, students who did not borrow worked an average of 23 hours per week when enrolled, and those who did borrow worked an average of 22 hours.

Parental Contributions and Work

Low income students attending full time, full year who received less than \$1,000 from their parents worked more while enrolled, on average (23 hours per week), than those who received \$1,000 or more from their parents (19 hours). This suggests that when parents are unable or unwilling to contribute, students work more.²⁰

¹⁹Considering low income students separately by dependency status, the difference was statistically significant for independents with dependents, but not for dependents or single independents.

²⁰U.S. Department of Education, National Center for Education Statistics, 1992–93 National Postsecondary Student Aid Study (NPSAS:93), Undergraduate Data Analysis System.

Persistence and Attainment Among Low Income Students

A frequent concern is that low income students may be forced to drop out or interrupt their education for financial reasons. In fact, among undergraduates enrolling in postsecondary education for the first time in 1989–90 who were seeking a degree or certificate, low income students were more likely than other students to have not attained and not be enrolled in 1994 (44 percent compared with 36 percent) (table 17). Limiting consideration to students seeking a bachelor's degree, the relationship was the same (although bachelor's degree seekers overall were less likely to be no longer enrolled): 30 percent of low income students had not completed their degree and were no longer enrolled, compared with 24 percent of other students (table 18).

Table 17—Percentage distribution of 1989–90 first-time beginners seeking any degree according to enrollment status in 1994, by income group in 1989–90

	Completed any degree	Still enrolled	No longer enrolled
Total	49.7	12.9	37.5
Income group

SOURCE: U. S. Department of Education, National Center for Education Statistics, Beginning Postsecondary Students Longitudinal Study Second Follow-up (BPS: 90/94), Data Analysis System.

If low income students were more likely than other students to have to interrupt their studies for financial reasons, this should be most evident among students seeking bachelor's degrees, because they take longer to complete. However, both groups were about equally likely to have interrupted their enrollment and returned whether they completed their studies or were still enrolled in 1994.

Persistence is affected by a variety of factors other than income. This study's approach of controlling for group differences by crosstabulation has limitations with survey data: sample size limits the number of cells into which the data can be usefully subdivided, and there are complex interrelationships among variables that cannot be disentangled in tabular analyses.

To overcome these limitations, linear models are frequently used to examine several sets of variables simultaneously. One such model, linear regression, is used here to estimate these effects (adjusted means).²¹ The regression model takes into account the effect of all variables in the model simultaneously and thus controls for interrelationships among variables that can influence tabular findings. By estimating the joint effect of all variables taken together, regression models can be used to test individual parameters while holding constant the influence of other variables.

Of particular interest here is whether the pattern of greater likelihood of leaving without completing or reenrolling found among low income students is related to their low income status, or whether it is related to other characteristics associated with persistence that are more common among low income students. Table 19 shows the adjusted percentages of 1989-90 beginning postsecondary students seeking degrees who completed any degree by 1994 or were still enrolled, taking into account other student characteristics. The unadjusted means are included for comparison.

²¹Appendix B contains a description of the means adjustment method. A logistic regression model would be an alternative to a linear regression model.

Low income was not a significant predictor of attaining any degree or being still enrolled in postsecondary education when other variables in the model were taken into consideration. Characteristics associated with a higher likelihood of attaining any degree or being still enrolled included being female, having parents with a bachelor's degree or higher (compared with high school or less), receiving parental contributions, and having taken out a loan in at least one year.²² Characteristics associated with a lower likelihood of attaining any degree or being still enrolled were being black, non-Hispanic (compared with white, non-Hispanic), enrolling part time to start, and borrowing from parents.

²²It should be noted, however, that income and borrowing are likely to be related. In addition, for dependent students, parental education and income are related.

Table 19—Percentage of 1989–90 beginning postsecondary students who had either attained a degree or who were still enrolled as of spring 1994, and the adjusted percentage after taking into account the covariation of the variables listed in the table¹

Summary and Conclusion

Twenty percent of all undergraduates have family incomes below 125 percent of the poverty threshold established by the federal government for their family size. The average budget for a full-time, full-year low income undergraduate in 1992–93 was \$10,900. However, according to the methodologies for calculating financial need, the expected average EFC for low income students was only \$1,600, leaving a large gap between educational costs and what low income families were expected to pay.

To help provide low income students with the opportunity to enroll in postsecondary education, the federal and state governments, the institutions in which students enroll, and other organizations supply a substantial amount of financial aid to help low income students pay for their postsecondary education. In 1992–93, 88 percent of all low income undergraduates who attended full time, full year received some form of aid (grants, loans, or work study), averaging a total of \$5,800 for those receiving aid. Financial aid covered an average of 42 percent of their total costs. For aided students, 65 percent of the aid was in the form of grants, on average, and 26 percent was in the form of loans.

Despite this financial aid, full-time, full-year low income students, on average, were left with costs that exceeded their EFC. The average net cost for these students (the amount the student and his or her family had to pay after subtracting total financial aid from student-reported costs) was \$7,600 (considerably higher than the average EFC of \$1,600).

Exactly how students cover these costs is unknown. However, the NPSAS data provide some information on parent contributions and work, two major sources of support. While low income students attending full time, full year were less likely than those who were not low income to receive parental contributions (37 percent compared with 68 percent), those who did receive money from their parents received an average of \$2,900. Full-time, full-year students worked an average of 22 hours per week while enrolled, whether or not they were low income. Those with low incomes who worked earned an average of \$4,200 during the 1992–93 academic year (including the summer).

According to these data, parental support and work do not appear to have been sufficient to cover low income students' net costs, on average, yet they still somehow managed to attend. How? One

possibility is that students overestimated their costs. It is very difficult for most people to remember exactly what they have spent on living expenses during any given year, especially if they are not living on campus and receiving room and board bills. Another possibility is that students actually earned more than they reported. Many students pick up extra cash through short-term jobs (sometimes lasting only a day), and this income may not have been included. They may also have underestimated the amount of money they received from their parents or they may have received substantial in-kind contributions from their parents or others.

Appendix A

Glossary

This glossary is arranged in alphabetical order. The variables were taken directly from the NCES NPSAS:93 Undergraduate Data Analysis System (DAS), as well as the NPSAS:90 DAS and the Beginning Postsecondary Students Longitudinal Study Second Followup (BPS:94) DAS. These are NCES software applications that generate tables from the NPSAS:93, NPSAS:90, and BPS:94 data, respectively. A description of the DAS software can be found in appendix B. The labels in parentheses correspond to the names of the variables in the DAS.

Age as of 12/31/92 (AGE)

Less than 24	Student was 23 years old or younger as of 12/31/92.
24 to 29 years	Student was between 24 and 29 years old as of 12/31/92.
30 years old or older	Student was 30 years old or older as of 12/31/92.

Attendance pattern (ATTNSTAT)

Attendance pattern describes the student's full- or part-time attendance while enrolled, as defined by the institution, and the number of months a student was enrolled during the year. Students were considered to have been enrolled for a full year if they were enrolled at least 9 months between July 1992 and June 1993.

Full-time, full-year	Student was enrolled full time, for the full year, at one or more institutions.
Full-time, part-year	Student was enrolled full time, for part of the year, at one or more institutions.
Part-time, full-year	Student was enrolled part time, for the full year, at one or more institutions.
Part-time, part-year	Student was enrolled part time, for part of the year, at one or more institutions.

Attendance status: intensity (ATTEND2)

Student's attendance status, as defined by the institution, during the fall or during the first month enrolled after October 1992.

Full-time	Student was enrolled full time in the first term enrolled.
Half-time or more	Student was enrolled less than full time, but at least half time in the first term enrolled.
Less than half-time	Student was enrolled less than half time or an unknown amount in the first term enrolled.

Considerations in Selecting the Institution (COURSEFF; SCHNWRK; LIVEHOME; GD_REP; SCHCLOSE; TUITLESS; PLACEMNT; SHORTER; FINAID)

Students were asked to indicate whether certain reasons were “very important,” “somewhat important,” or “not important” to them in deciding upon the school they attended in fall 1989. Table 4 reports the percentages of students who reported the following reasons were “very important”:

- The school offered the course of study the student wanted.
- The student could work while attending the school.
- The student could live at home.
- The school had a good reputation.
- The school was close to home.
- The tuition and other direct school expenses were less at the school than at other schools.
- The school had a good reputation for placing its graduates.
- The student could finish the course in a short period of time.
- The student obtained the financial aid needed at the school.

Contribution from parents (SPARSPRT)

Student-reported amount of direct monetary contribution from both parents for academic year 1992–93 school expenses, not including loans or income-in-kind.

Degree program (PROGRAM)

Degree program in which the student was enrolled; reported by the institution.

Associate’s	Student was pursuing an associate’s degree.
Bachelor’s	Student was pursuing a Bachelor of Arts or Bachelor of Science degree.
Certificate/formal award	Student was pursuing a certificate or other formal program other than an associate’s or bachelor’s degree.
Other undergraduate	Student was not in any of the above programs.

Delayed enrollment in postsecondary education (DELAYENR)

Student delayed enrollment into postsecondary education. Immediate enrollment is defined as entry into PSE the same calendar year as graduating from high school or receiving a GED. The assumption is that high school graduation takes place in May or June and entry into PSE takes place the subsequent summer or fall of the same year.

Did not delay	Student entered PSE the same calendar year as high school graduation or GED receipt.
1 year	Student entered PSE in the year after the year of high school graduation or GED receipt. Note that in the rare event a high school student graduated in December and entered PSE the following January, the student would be considered a delayed entrant.
2–4 years	Student entered PSE 2 to 4 years after the year of high school graduation or GED receipt.
5 years or more	Student entered PSE 5 years or more after the year of high school graduation or GED receipt.

Dependency status for financial aid (DEPEND2)

Dependent	Student was considered financially dependent for financial aid purposes.
Single independent	Student was considered financially independent for financial aid purposes and had no dependents.
Independent with dependents	Student was considered financially independent for financial aid purposes and had dependents. Spouses were considered dependents.

Enrollment status in 1994:

Persistence toward a bachelor's degree (PERABA)

Persistence and attainment toward a bachelor's degree. Includes all undergraduates who were first-time beginners in the 1989-90 academic year and who reported at any time during their postsecondary careers that they were seeking a bachelor's degree (not institution-based). This variable tracks their persistence and attainment toward a bachelor's degree from the first time undergraduates indicated that they were seeking a degree.

Completer, no interruption	Student earned the bachelor's degree without any interruptions longer than 4 months.
Completer, with interruption	Student earned the bachelor's degree with at least one interruption of more than 4 months.

Still enrolled, no interruption	Student was still seeking the bachelor's degree in 1994, and had not interrupted study for more than 4 months.
Still enrolled, with interruption	Student was still seeking the bachelor's degree in 1994, and had interrupted study for more than 4 months at least once.
No longer enrolled	Student was seeking the bachelor's degree, had stopped enrollment and had not re-enrolled.
Changed degree objective	Student had been seeking the bachelor's degree but had since stated a different goal.

Enrollment status in 1994:

Persistence toward any degree (PERADEG)

Persistence and attainment toward any degree or certificate. Includes all undergraduates who were first-time beginners in the 1989–90 academic year who were seeking a degree or certificate. This variable shows where students ended up by the second followup with respect to specific degree attained and current enrollment.

Completed any degree	Student earned a certificate, associate's degree, or bachelor's degree.
Still enrolled	Student was enrolled in a degree or certificate program in 1994.
No longer enrolled	Student had stopped enrollment and was not enrolled in 1994.

Expected family contribution (EFC4)

Expected family contribution (EFC) as recorded by the institution. EFC is the amount of financial support for the student's undergraduate education that is expected to be provided by the student's family, or directly by the student if the student was financially independent. This amount is used to determine financial need, and is based upon dependency status, family income and assets, family size, and the number of children enrolled in postsecondary education. If this information was not available from the institution, then it was gathered from the financial aid system, from the student interview, or was imputed from student income. The average EFC is the average for all undergraduates.

Federal aid amount (TFEDAID)

Total amount of federal financial aid, including loans, grants, work study, and all other federal aid, excluding VA/DOD aid.

Federal aid/total aid (FEDPCT)

The proportion of total aid from federal sources, expressed as a percentage. The average ratio of federal aid to total aid is the average ratio for all students who received any aid.

Federal grants (TFEDGRT)

Total federal grants, including Pell grants, Supplemental Educational Opportunity Grants (SEOG), and other federal grants, scholarships, fellowships, and traineeships. These are all forms of student financial aid that do not require repayment or employment. This information was taken from financial aid records, as well as directly from the students.

Federal loans (TFEDLN)

Total federal loans to undergraduates, except PLUS loans (which are made to parents). Loans are a type of student financial aid that advances funds that are evidenced by a promissory note requiring the recipient to repay the specified amounts under prescribed conditions. Includes Perkins, Stafford, Supplemental Loans for Students (SLS), and all other federal loan programs. If this information was not available from financial aid records, student-reported information was used.

Financial need (Student budget minus expected family contribution) (SNEED3)

Financial need, equal to the sum of tuition actually charged and total non-tuition budget components, adjusted for attendance status (BUDGETAJ) less expected family contribution (EFC4). Students whose EFC exceeded need were assigned a value of zero for this variable. The average need is the average for all students, including those whose EFC was zero.

Grants (TOTGRT)

Total grants received in 1992–93. Grants are a type of student financial aid that does not require repayment or employment. Grants include scholarships and fellowships. Employer aid is also considered a grant.

Grants/total aid (GRTPCT)

The proportion of total aid that was grant aid, expressed as a percentage. The average ratio of grants to total aid is the average ratio for all students who received any aid.

Gender of student (GENDER)

Male

Female

Highest level of education ever expect to complete (ANYHILVL)

The highest level of education students reported they hoped to achieve.

Certificate/formal award	Student expected to earn a vocational certificate or license; or to attend college, but not to earn a bachelor's degree.
Associate's degree	Student expected to earn an associate's degree but not a bachelor's degree.
Bachelor's degree	Student expected to earn a bachelor's degree but not an advanced degree.
Advanced Degree	Student expected to earn a master's, doctoral, or first-professional degree.

Highest level of parent education (PAREduc)

The highest level of education completed by the student's parents (mother or father, whichever was highest).

High school or less	Neither parent had any postsecondary education. Both parents graduated from high school or received a General Educational Development certificate (GED), or did not complete high school.
Some college	One or both parents had some postsecondary education, less than a bachelor's degree but including an associate's degree.
Bachelor's degree	One or both parents earned a bachelor's degree as their highest award.
More than a bachelor's degree	One or both parents earned an advanced degree including a master's degree, Ph.D., M.D., and so on.

Hours worked per week while enrolled in 1992-93 (EMWKHR3)

The average number of hours worked per week while enrolled (including work study). If a student reported being employed during the month, the average number of hours worked per week was derived based on the starting and ending dates and the hours reported for each job during the survey interview. Note that this variable only represents the average hours a student worked while working and enrolled. Thus, if a student worked an average of 20 hours per week while enrolled for 6 months and then did not work for the remaining 3 months of enrollment, the average hours would still be 20 hours per week.

Income: percent of poverty level (PCTPOV91)

Total income in 1991 as a percentage of federal poverty level thresholds for that year, as defined by the Bureau of the Census, based upon income, family size, and dependency status. (Income in 1991 was reported on financial aid applications for the 1992–93 academic year.) If the student was independent, the student’s income and family size were used. If the student was dependent, parents’ income and family size were used. The maximum ratio was set at 1,000 percent, and all values above that were set at 1,000 percent. A value below 100 percent means the family was below the poverty income level in 1991. Poverty cutoffs for 1991 were based upon family size as follows:

Family size	Poverty threshold
1	\$7,086
2	\$9,165
3	\$10,860
4	\$13,924
5	\$16,456
6 or more	\$18,587

Income: percent of poverty level (PCTPVRTY): Tables 4, 17, and 18 only

Total income in 1988 as a percentage of federal poverty level thresholds for that year, as defined by the Bureau of the Census, based upon income, family size, and dependency status. (Income in 1988 was reported on financial aid applications for the 1989–90 academic year). If the student was independent, student’s income and family size were used. If the student was dependent, parents’ income and family size were used. A value below 100 percent means the family was below the poverty income level in 1988. Poverty cutoffs for 1988 were based upon family size as follows:

Family size	Poverty threshold
1	\$ 6,155
2	\$ 7,958
3	\$ 9,056
4	\$12,092
5	\$14,305
6 or more	\$16,149

Institutional aid/total aid (INSTPCT)

The proportion of total aid that was institutional aid, expressed as a percentage. The average ratio of institutional aid to total aid is the average ratio for all students who received any aid.

Institutional aid amount (INSTAMT)

Total institutional aid amount. Institutional aid includes grants and loans from the institution attended, work-study positions, and research and teaching assistantships. It also includes assistantships funded by federal research grants.

Institutional grants (INGRTAMT)

Total amount of grants provided by the institution. Grants are a type of student financial aid that do not require repayment or employment. This aid includes both need-based and non-need-based tuition waivers, employee-related tuition waivers, and school-based academic and athletic scholarships.

Institutional level and control (SECTOR_B)

Institution type by level and control. Institution level indicates the institution's highest offering (length of program and type of certificate, degree, or award), and control indicates the source of revenue and control of operations.

Public less-than-4-year	Public less-than-4-year institution.
Public 4-year	Public 4-year institution.
Private, not-for-profit less-than-4-year	Private independent less-than-4-year institution.
Private, not-for-profit 4-year	Private independent 4-year institution.
Private, for-profit	Private, for-profit institution.

Local residence (LOCRES2)

On campus	Student lived in institution-owned living quarters for students on campus.
Off campus, with parents or relatives	Student lived with parents or other relatives off campus.
Other	Student lived off campus, not with parents or other relatives.

Loans/total aid (LOANPCT)

The percentage of total aid that was loans, expressed as a percentage. This variable is based on the ratio of TOTLOAN to TOTAID. The average ratio of loans to total aid is the average ratio for all students who received aid.

Loans (TOTLOAN)

Total loans received between 1992–93. This includes all loans through federal, state, or institutional programs except PLUS loans (which are made to parents). Loans are a type of student financial aid that advances funds evidenced by a promissory note requiring the recipient to repay the specified amounts under prescribed conditions.

Longitudinal sample weight (BPS94AWT)

Primary cross-sectional and longitudinal weight for BPS data used in the multivariate analysis. This weight allows for analysis of trends up through the 1993–94 academic year among the population of students who were first-time beginners in postsecondary education in the 1989–90 academic year. This weight takes advantage of both the BPS first followup (1991–92) and second followup (1993–94) surveys.

Marital status in 1992–93 (SMARITAL)

Student's marital status as of NPSAS interview date.

Not married or separated

Married

Net Cost: Total costs minus aid (NETCST1)

Net costs of attendance after all financial aid, adjusted for attendance. Equal to student-reported total costs of attendance (tuition and non-tuition expenses), adjusted for attendance status (TOTCOSTA), minus the total amount of all aid (TOTAID). The average cost is the average for all students, including those who did not report costs that exceeded total aid.

Pell grants (PELLAMT)

Total Pell grant amount. Grants are a type of student financial aid that does not require repayment or employment. Pell grants are awarded to undergraduates who have not yet earned a bachelor's degree and are intended as a financial base to which other forms of aid may be added. Award amounts were based upon need, the cost of the institution attended, and attendance status. To be eligible, students must attend at least half time. The maximum award in 1992–93 was \$2,400.

Perkins loan amount (PERKAMT)

Amount of federal Perkins loan. The Perkins loan is a campus-based low interest loan for students who show exceptional financial need. Total awards, including awards from all previous years, cannot exceed \$9,000 for undergraduate students.

Race–ethnicity (RACE)

Asian/Pacific Islander	A person having origins in any of the original peoples of the Far East, Southeast Asia, the Indian Subcontinent, or Pacific Islands. This includes people from China, Japan, Korea, the Philippine Islands, Samoa, India, and Vietnam.
Black, non-Hispanic	A person having origins in any of the black racial groups of Africa, not of Hispanic origin.
Hispanic	A person of Mexican, Puerto Rican, Cuban, Central or South American, or other Spanish culture or origin, regardless of race.
American Indian/ Alaskan Native	A person having origins in any of the original peoples of North America and who maintains cultural identification through tribal affiliation or community recognition.
White, non-Hispanic	A person having origins in any of the original peoples of Europe, North Africa, or the Middle East (except those of Hispanic origin).

Single parent (SINGLPAR)

Students who had dependents but were not married. Note that in the rare case a student was caring for dependents who were not the student’s children (e.g., elderly parents or relatives) and the student was not married, the student is identified as a single parent.

Stafford amount (STAFFAMT)

Amount of Stafford loans during 1992–93. This includes all Stafford loans taken out at all institutions the student attended during the year. Stafford loans are long-term, low-interest loans administered by the federal government. Students borrow money for education expenses directly from banks or other lending institutions. The loans are guaranteed by the federal government. This program was formerly known as the Guaranteed Student Loan (GSL) program.

Stafford loan amount categories (STAFFCAT)

Stafford loan amounts, ordered into three categories:

None	Student did not receive a Stafford loan.
Some	Student received a Stafford loan of less than \$4,000 (the maximum amount).
Maximum	Student received the maximum Stafford loan amount.

State aid amount (STATEAMT)

Total amount of state aid received in 1992–93. State aid includes state-based grants, loans, workstudy, and other state-based awards.

State aid/total aid (STAPCT)

The proportion of total aid that was state aid, expressed as a percentage. The average ratio of state aid to total aid is the ratio for all students who received any aid.

State grants (STGTAMT)

Total state-based grants, scholarships, fellowships, and traineeships, including the federal portion of State Student Incentive Grants (SSIG). These are all forms of student financial aid that do not require repayment or employment. If this information was not available from financial aid records, student-reported information was used.

Student budget, attendance-adjusted (BUDGETAJ)

Total student budget, equal to the sum of tuition actually charged and total non-tuition budget components, adjusted for attendance status. The average budget is the average for all students who had tuition and/or non-tuition expenses.

Student earnings, academic year (WKINC)

Total student income from all jobs between July 1, 1992 and June 30, 1993, including workstudy and assistantships, regardless of dependency status. These data were based upon student-reported information.

Supplemental Education Opportunity Grant (SEOGAMT)

The Supplemental Education Opportunity Grant (SEOG) is a campus-administered federal grant available to undergraduates who show exceptional financial need. Grants are a type of student financial aid that does not require repayment or employment. The SEOG is intended to supplement the Pell grant, and priority is given to undergraduates who have received a Pell grant. The maximum award is \$4,000 per year. Eligibility for a SEOG grant does not guarantee receipt of an award, as funds available to each institution are limited. Eligibility is not based upon intensity of enrollment, so undergraduates who are enrolled less than half time may be eligible for a SEOG grant.

Supplemental Loan for Students amount (SLSAMT)

Amount of federal SLS (Supplemental Loan for Students). SLS loans are variable-interest rate (maximum 12 percent) loans that are awarded to independent undergraduates who are attending school at least half time. For students in full-year programs, the maximum loan amount is \$4,000, provided the total of all loans does not exceed \$20,000. SLS loans are offered by commercial lenders and interest accrues while the student is enrolled.

Total aid (TOTAID)

Total amount of all financial aid received from all sources, including federal, state, institution, and other sources. The percentage of students who received any financial aid is the percentage with positive amounts recorded for this variable. The average amount received is the average for all students who received any financial aid.

Total aid/student-reported cost (AIDCST2)

Ratio of total aid to student-reported total cost, adjusted for attendance. The average ratio is the average for all students who reported having costs of attendance.

Total amount of parent loans to student (SPARLOAN)

Student-reported sum of loans from both parents for 1992–93 academic year.

Total costs (TOTCOSTA)

Student-reported total costs, including tuition and fees and all other costs. The average amount is the average for all students, including those who did not report having any of these costs.

Unmet need: Student budget minus expected family contribution and aid (SNEED4)

Unmet need, equal to the sum of tuition actually charged and total non-tuition budget components, adjusted for attendance status (BUDGETAJ) less expected family contribution (EFC4) and total aid received that is subject to EFC limitations. Students whose expected family contribution and EFC-based aid exceeded need were assigned a value of zero for this variable.

Work study (TOTWKST)

Total work-study aid received. Work-study programs provide partial reimbursement of wages paid to students. They may be sponsored by the federal or state governments or by the institution.

Appendix B

Technical Notes and Methodology

The 1992–93 National Postsecondary Student Aid Study

The need for a nationally representative database on postsecondary student financial aid prompted the U.S. Department of Education to conduct the National Postsecondary Student Aid Study (NPSAS), a survey conducted every three years beginning in 1987. The NPSAS sample was designed to include students enrolled in all types of postsecondary education. Thus, it included students enrolled in public institutions; private, not-for-profit institutions; and private, for-profit institutions. The sample included students at 4-year and 2-year institutions, as well as students enrolled in occupationally specific programs that lasted for less than 2 years. United States service academies were not included in the institution sample because of their unique funding and tuition base, and certain other type of institutions were also excluded.²³

NPSAS:93 included a stratified sample of approximately 66,000 eligible students (about 52,000 of whom were undergraduates) from about 1,100 institutions. Students were included in the sample if they attended a NPSAS-eligible institution; were enrolled between July 1, 1992 and June 30, 1993; and were enrolled in one or more courses or programs including courses for credit, a degree or formal award program of at least 3 months' duration, or an occupationally or vocationally specific program of at least 3 months' duration. Regardless of their postsecondary status, however, students who were also enrolled in high school were excluded.

The 1992–93 NPSAS survey sample, while representative and statistically accurate, was not a simple random sample. Instead, the survey sample was selected using a more complex three-step procedure with stratified samples and differential probabilities of selection at each level. First, postsecondary institutions were initially selected within geographical strata. Once institutions were organized by zip code and state, they were further stratified by control (i.e., public; private, not-for-profit; or private, for-profit) and offering (less-than-2-year, 2- to 3-year, 4-year nondoctorate-granting, and 4-year doctorate-granting). Sampling rates for students enrolled at different institutions and levels (undergraduate or other) varied, resulting in better data for policy purposes, but at a cost to statistical efficiency.

For each student in the NPSAS sample, there were up to three sources of data. First, institution registration and financial aid records were extracted. Second, a Computer Assisted Telephone Interview (CATI) was conducted with each student. Finally, a CATI designed for

²³Other excluded institutions were those offering only avocational, recreational, or remedial courses; those offering only in-house business courses; those offering only programs of less than 3 month's duration; and those offering only correspondence courses.

the parents or guardians of a subsample of students was conducted. Data from these three sources were synthesized into a single system with an overall response rate of about 85 percent.

For more information on the NPSAS survey, consult *Methodology Report for the 1993 National Postsecondary Student Aid Study* (Longitudinal Studies Branch, Postsecondary Education Statistics Division, Washington, D.C.: U.S. Department of Education, National Center for Education Statistics, NCES 95-211).

Beginning Postsecondary Student Longitudinal Study

The Beginning Postsecondary Student Longitudinal Study (BPS) follows NPSAS:90 students who enrolled in postsecondary education for the first time in 1989–90. The first followup was conducted in spring 1992 and the second in spring 1994. BPS collected information from students on their persistence, progress, and attainment and on their labor force experience using a CATI. Approximately 8,000 students were included in the BPS sample.

Accuracy of Estimates

The statistics in this report are estimates derived from a sample. Two broad categories of error occur in such estimates: sampling and non-sampling errors. Sampling errors occur because observations are made only on samples of students, not on entire populations. Non-sampling errors occur not only in sample surveys but also in complete censuses of entire populations.

Non-sampling errors can be attributed to a number of sources: inability to obtain complete information about all students in all institutions in the sample (some students or institutions refused to participate, or students participated but answered only certain items); ambiguous definitions; differences in interpreting questions; inability or unwillingness to give correct information; mistakes in recording or coding data; and other errors of collecting, processing, sampling, and imputing missing data.

Data Analysis System

The estimates presented in this report were produced using the NPSAS:93 Undergraduate Data Analysis System (DAS) and the BPS:90/94 DAS. The DAS software makes it possible for users to specify and generate their own tables from the NPSAS data. With the DAS, users can recreate or expand upon the tables presented in this report. In addition to the table estimates, the DAS calculates proper standard errors²⁴ and weighted

²⁴The NPSAS sample is not a simple random sample and, therefore, simple random sample techniques for estimating sampling error cannot be applied to these data. The DAS takes into account the complexity of the sampling procedures and calculates standard errors appropriate for such samples. The method for computing sampling errors used by the DAS involves approximating the estimator by the linear terms of a

sample sizes for these estimates. For example, table B. 1 presents the standard errors that correspond to table 8 in the text. If the number of valid cases is too small to produce an estimate, the DAS prints the message “low-N” instead of the estimate.

In addition to tables, the DAS will also produce a correlation matrix of selected variables to be used for linear regression models. Also output with the correlation matrix are the design effects (DEFT) for all the variables identified in the matrix. Since statistical procedures generally compute regression coefficients based on simple random sample assumptions, the standard errors must be adjusted with the design effects to take into account the NPSAS stratified sampling method. (See discussion under “Statistical Procedures” below for the adjustment procedure.)

Statistical Procedures

Two types of statistical procedures were employed in this report: testing differences between means, and adjustment of means after controlling for covariation among a group of variables. Each procedure is described below.

Differences Between Means

The descriptive comparisons were tested in this report using Student’s *t* statistic. Differences between estimates are tested against the probability of a Type I error, or significance level. The significance levels were determined by calculating the Student’s *t* values for the differences between each pair of means or proportions and comparing these with published tables of significance levels for two-tailed hypothesis testing.

Student’s *t* values may be computed to test the difference between estimates with the following formula:

$$t = \frac{E_1 - E_2}{\sqrt{se_1^2 + se_2^2}} \quad (1)$$

Taylor series expansion. The procedure is typically referred to as the Taylor series method.

where E_1 and E_2 are the estimates to be compared and se_1 and se_2 are their corresponding standard errors. Note that this formula is valid only for independent estimates. When the estimates were not independent (for example, when comparing the percentages across a

-Sample size was too small for a reliable estimate.

SOURCE: U. S. Department of Education, National Center for Education Statistics, 1992-93 National Postsecondary Student Aid Study (NPSAS: 93), Undergraduate Data Analysis System.

percentage distribution), a covariance term was added to the denominator of the t -test formula.

There are hazards in reporting statistical tests for each comparison. First, comparisons based on large t statistics may appear to merit special attention. This can be misleading, since the magnitude of the t statistic is related not only to the observed differences in means or percentages but also to the number of students in the specific categories used for comparison. Hence, a small difference compared across a large number of students would produce a large t statistic.

A second hazard in reporting statistical tests for each comparison occurs when making multiple comparisons among categories of an independent variable. For example, when making paired comparisons among different levels of income, the probability of a Type I error for these comparisons taken as a group is larger than the probability for a single comparison. When more than one difference between groups of related characteristics or "families" are tested for statistical significance, one must apply a standard that assures a level of significance for all of those comparisons taken together.

Comparisons were made in this report only when $p \leq .05/k$ for a particular pairwise comparison, where that comparison was one of k tests within a family. This guarantees both that the individual comparison would have $p \leq .05$ and that for k comparisons within a family of possible comparisons, the significance level for all the comparisons will sum to $p \leq .05$.²⁵

For example, in a comparison of the percentages of males and females who enrolled in postsecondary education only one comparison is possible (males versus females). In this family, $k=1$, and the comparison can be evaluated without adjusting the significance level. When students are divided into five racial-ethnic groups and all possible comparisons are made, then $k=10$ and the significance level of each test must be $p \leq .05/10$, or $p \leq .005$. The formula for calculating family size (k) is as follows:

$$k = \frac{j \times (j-1)}{2} \tag{2}$$

²⁵The standard that $p \leq .05/k$ for each comparison is more stringent than the criterion that the significance level of the comparisons should sum to $p \leq .05$. For tables showing the t statistic required to ensure that $p \leq .05/k$ for a particular family size and degrees of freedom, see Olive Jean Dunn, "Multiple Comparisons Among Means," *Journal of the American Statistical Association* 56: 52-64.

where j is the number of categories for the variable being tested. In the case of race–ethnicity, there are five racial-ethnic groups (American Indian, Asian/Pacific Islander, black non-Hispanic, Hispanic, and white non-Hispanic), so substituting 5 for j in equation 2,

$$k = \frac{5 \times (5 - 1)}{2} = 10$$

Adjustment of Means

Tabular results are limited by sample size when attempting to control for additional factors that may account for the variation observed between two variables. For example, when examining the percentages of those who completed a degree, it is impossible to know to what extent the observed variation is due to low income status differences and to what extent it is due to differences in other factors related to income, such as type of institution attended, parents' education, and so on. However, if a table were produced showing income within, type of institution within parent's education within, for example, the cell sizes would be too small to identify the patterns. When the sample size becomes too small to support controls for another level of variation, one must use other methods to take such variation into account.

To overcome this difficulty, multiple linear regression was used to obtain means that were adjusted for covariation among a list of control variables. Adjusted means for subgroups were obtained by regressing the dependent variable on a set of descriptive variables such as gender, race–ethnicity, parents' education, etc. Substituting ones or zeros for the subgroup characteristic(s) of interest and the mean proportions for the other variables results in an estimate of the adjusted proportion for the specified subgroup, holding all other variables constant. For example, consider a hypothetical case in which two variables, age and gender, are used to describe an outcome, Y (such as completing a degree). The variables age and gender are recoded into a dummy variable representing age and a dummy variable representing gender:

Age	A
24 years or older	1
Under 24 years old	0

and

Gender	G
Female	1
Male	0

The following regression equation is then estimated from the correlation matrix output from the DAS:

$$\hat{Y} = a + \beta_1 A + \beta_2 G \quad (3)$$

To estimate the adjusted mean for any subgroup evaluated at the mean of all other variables, one substitutes the appropriate values for

that subgroup's dummy variables (1 or 0) and the mean for the dummy variable(s) representing all other subgroups. For example, suppose we had a case where Y was being described by age (A) and gender (G), coded as shown above, and the means for A and G are:

Variable	Mean
A	0.355
G	0.521

Suppose the regression equation results in:

$$\hat{Y} = 0.15 + (0.17)A + (0.01)G \quad (4)$$

To estimate the adjusted value for older students, one substitutes the appropriate parameter values into equation 3.

Variable	Parameter	Value
a	0.15	—
A	0.17	1.000
G	0.01	0.521

This results in:

$$Y = 0.15 + (0.17)(1) + (0.01)(0.521) = 0.325 \quad (5)$$

In this case the adjusted mean for older students is 0.325 and represents the expected outcome for older students who look like the average student across the other variables (in this example, gender).

It is relatively straightforward to produce a multivariate model using NPSAS: 93 or BPS: 90/94 data, since one of the output options of the DAS is a correlation matrix, computed using pairwise missing values.²⁶ This matrix can be used by most commercial regression packages as the input data to produce least-squares regression estimates of the parameters. That was the general approach used for this report, with two additional adjustments described below to incorporate the complex sample design into the statistical significance tests of the parameter estimates.

Most commercial regression packages assume simple random sampling when computing standard errors of parameter estimates. Because of the complex sampling design used for NPSAS: 93, this assumption is incorrect. A better approximation of their standard errors is to multiply each standard error by the average design

²⁶Although the DAS simplifies the process of making regression models, it also limits the range of models. Analysts who wish to use different error assumptions than pairwise or to estimate probit/logit models can apply for a restricted data license from NCES.

effect of the dependent variable (DEFT),²⁷ where the DEFT is the ratio of the true standard error to the standard error computed under the assumption of simple random sampling. It is calculated by the DAS and produced with the correlation matrix.

²⁷The adjustment procedure and its limitations are described in C. J. Skinner, D. Holt, and T. M. F. Smith, eds. *Analysis of Complex Surveys* (New York: John Wiley & Sons, 1989).
