Abstract:

Integration of remote content and application logic into an End-User presentation has been a task requiring significant custom programming effort. Typically, vendors of aggregating applications, such as a portal, write special adapters for applications and content providers to accommodate the variety of different interfaces and protocols those providers use. The goal of this specification is to enable an application designer or administrator to pick from a rich choice of compliant remote content and application providers, and integrate them with just a few mouse clicks and no programming effort.

This specification is the effort of the OASIS Web Services for Remote Portlets (WSRP) technical committee which aims to simplify the integration effort through a standard set of web service interfaces allowing integrating applications to quickly exploit new web services as they become available.

This standard layers on top of the existing web services stack, utilizing existing web services standards and will leverage emerging web service standards (such as policy) as they become available. The interfaces are defined using the Web Services Description Language (WSDL).

Status:

This version is a draft of the OASIS WSRP Technical Committee. Comments about points needing clarification are much appreciated and may be emailed to *Rich Thompson*.

If you are on the wsrp@lists.oasis-open.org list for committee members, send comments there. If you are not on that list, send comments using the OASIS comment facility at http://www.oasis-open.org/committees/comments/form.php?wg_abbrev=wsrp.

Table of Contents

1 Introduction

The Web Services for Remote Portlets specification defines a web service interface for accessing and interacting with interactive presentation-oriented web services. It has been produced through the efforts of the Web Services for Remote Portlets (WSRP) OASIS Technical Committee. It is based on the requirements gathered by both committees and on the concrete proposals to both committees.

Scenarios that motivate WSRP functionality include:

- Portal servers providing portlets as presentation-oriented web services that can be used by aggregation engines.
- Portal servers consuming presentation-oriented web services provided by portal or non-portal content providers and integrating them into a portal framework.

However this description also applies to non-portal environments, mostly identified by the use cases defined by the Web Services for Interactive Applications (WSIA) OASIS Technical Committee. The WSIA use cases[1] have become input to the ongoing effort in this area by the WSRP OASIS Technical Committee. For additional details and documents, refer to the committee information available at http://www.oasis-open.org/committees/wsrp/ and http://www.oasis-open.org/committees/wsia/.

This specification accounts for the fact that **Producers** (web services conforming to this specification) and **Consumers** (applications consuming Producers in a manner conforming to this specification) may be implemented on very different platforms, be it as a **[J2EE]*~~[J2EE]~~*** based web service, a web service implemented on Microsoft's **[.Net]*~~[.Net]~~*** platform or a portlet published directly by a portal [A100]. Special attention has been taken to ensure this platform independence.

These web services are built on standard technologies, including **[SSL/TLS]*~~[SSL/TLS]~~***, **[URI/URL]*~~[URI/URL]~~***, **[WSDL]*~~[WSDL]~~*** and **[SOAP]*~~[SOAP]~~***, and expects to leverage future applicable Web Service standards, such as WS-Security and WS-Policy (see section 3.1) [A102] in future versions.

1.1 Motivation

Portals and other Web applications render and aggregate information from different sources and provide it in a compact and easily consumable form to an End-User.

Among typical sources of information are web services. Traditional data-oriented web services, however, require aggregating applications to provide specific presentation logic for each of these web services. Furthermore, each aggregating application communicates with each web service via its unique interface. This approach is not well suited to dynamic integration of business applications and content as a plug-and-play solution.

This specification solves this problem by introducing a presentation-oriented web service interface that allows the inclusion of and interaction with content from a web service. Such a

[1] http://www.oasis-open.org/committees/wsia/use_cases/index.shtml

presentation-oriented web service provides both application logic and presentation logic. This specification provides a common protocol and a set of interfaces for presentation-oriented web services. Thus, aggregating applications can easily adopt these web services by utilizing generic proxy code.

1.2 Actors

This protocol describes the conversation between Producers and Consumers on behalf of End-Users (clients of the Consumer). Producers are presentation-oriented web services that host Portlets which are able to render markup fragments and process user interaction requests. Consumers use these web services to present the generated markup to End-Users and manage the user's interaction with the markup.

1.2.1 Portlet

Portlets are hosted by Producer web services and generate markup as well as processing interactions with that markup. In general a Portlet includes both logic conforming to some specification of the Producer's environment and a particular configuration of any settings or properties the Portlet exposes.

1.2.2 Producer

Producers are modeled as containers of Portlets. The Producer provides a set of web service interfaces, including:

- *Self Description:* A required interface that allows Consumers to find out the capabilities of the Producer and about the Portlets it hosts, including the metadata necessary for a Consumer to properly interact with each Portlet.
- *Markup:* A required interface used to request and interact with markup fragments.
- *Registration:* An optional interface used to establish a relationship between a Producer and a Consumer (e.g. for billing or book-keeping purposes).
- *Portlet Management:* An optional interface that grants access to the life-cycle of the hosted Portlets. This interface also includes *Property Management,* which enables programmatic access to a Portlet's persistent state.

In order to allow different levels of sophistication for both the Producer and Consumer, parts of this functionality are optional. Various examples of how a Producer might implement particular functionality for varying levels of sophistication and with regards to implementing some of the optional portions of the protocol are contained throughout this document.

The Producer optionally manages Consumer *registrations*. The Producer may require Consumers to register prior to discovering and interacting with Portlets. A registration represents a relationship (often including both technical and business aspects) between the Consumer and Producer.

1.2.2.1 Portlet Management

A particular Portlet is identified with a `portletHandle`. The Consumer uses `portletHandles` throughout the communication to address and interact with Portlets via the Producer. The Portlets a Producer publishes as available for all Consumers to interact with are called "Producer Offered Portlets". Producer Offered Portlets are pre-configured and not modifiable by Consumers.

If the Producer chooses to expose the *Portlet Management* interface, it is allowing Consumers to clone the Portlets offered by the Producer and customize those cloned Portlets. Such a uniquely configured Portlet is called a "Consumer Configured Portlet". Like Producer Offered Portlets, a

`portletHandle` is used to address Consumer Configured Portlets. This `portletHandle` is both; 1) invariant until released and 2) unique within and scoped to the Consumer registration.

1.2.3 Consumer

A Consumer is an intermediary system that communicates with presentation-oriented web services (i.e. Producers and the Portlets they host) on behalf of its users. It gathers and aggregates the markup delivered by the Portlets and presents the aggregation to the End-User. Because of this intermediary role, Consumers are often compared to "message switches" that route messages between various parties. One typical Consumer is a portal, which mediates the markup and the interaction with this markup between End-Users and presentation-oriented web services. Another typical Consumer is an e-Commerce application that aggregates manufacturer-provided content into its own pages. Since the Consumer is an intermediary, aggregating system, the markup sent for display to the End-User and most interactions with that markup flow through the Consumer. This often results in situations where the End-User implicitly trusts the Consumer to respect their privacy and security concerns with regards to this information flow.

While this specification is neutral as to the markup used to represent the user interface to the End-User, we note that general performance concerns favor markup technologies that push the processing of user interface logic, such as the validation of End-User input, as far toward the user agent as possible. Client-side scripting and XForms[2] represent technologies that can be leveraged to address these performance concerns. Note that use of such technologies does not relieve the need for a Portlet to validate the input data it receives.

1.2.4 End-User

The main purpose of a Consumer that aggregates content from various Producers/Portlets is the preparation and presentation of markup to an End-User. In addition, the Consumer needs to manage the processing of interactions with that markup in order to properly correlate the interactions with the, potentially stateful, environment that produced the markup.

1.3 Typical Process Flow

While some of the following steps are optional, the typical flow of interactions between these actors is:

1. Consumer "discovers" the Producer. This involves the Consumer learning the URL of the web service end-point for the Producer and getting the Producer's metadata with its description of the registration requirements and possibly an indication of the portlets the Producer is exposing.
2. Establishment of a relationship between the Consumer and Producer. This may involve the exchange of information regarding capabilities, security requirements or other business and/or technical aspects of the relationship.
3. Consumer learning the full capabilities and services of the Producer based on the now established relationship.
4. Establishment of a relationship between the Consumer and End-User. This permits the Consumer to authenticate the End-User and may allow the End-User to customize the aggregated pages presented by the Consumer.
5. Production of aggregated pages. This typically involves the Consumer defining some base level of page design (often with customized Portlets) and may involve further customization of those pages by the End-User.

[2] http://www.w3.org/TR/xforms/

6. Request for a page. This typically results when the End-User directs a user-agent (e.g. browser) to the Consumer's URL, but also occurs indirectly as a result of processing an interaction with the markup of a previous page.
7. Processing interactions. Some End-User interactions with the markup of a page will result in an invocation on the Consumer to provide some logical function. The Consumer will process this invocation to determine the Producer/Portlet that the interaction has targeted and the nature of the invocation requested for that Portlet. Since the resulting invocation of that Portlet is likely to change its state (and may also change the state of other Portlets), the Consumer must also treat this as an indirect request for a page and thereby loop back to step 6.
8. Destruction of relationships. Producers and Consumers may choose to end a registration relationship at any time. The protocol provides means by which the Producer and Consumer may inform each other that the relationship (or some portion of it) has ended and that related resources may be cleaned up.

2 Terminology

The key words MUST, MUST NOT, REQUIRED, SHALL, SHALL NOT, SHOULD, SHOULD NOT, RECOMMENDED, MAY, and OPTIONAL in this document are to be interpreted as described in **[RFC2119]*~~[RFC2119]~~***.

Compliance: Mandatory – relevant to legal rules, regulations or laws. Compliancy is the act of complying with a specification and/or standard. Example: ISO 9001. IEEE defines as complying with laws and regulations.

Conformance: Not mandatory – ISO/IEC Guide 2 defines conformance or conformity as fulfillment of a product, process or service of specified requirements.

Cross references to the **[Requirements]*~~[Requirements]~~*** developed by both the WSIA and WSRP technical committees are designated throughout this specification by a hyperlink to the requirement contained where the requirement number is enclosed in square brackets (e.g. [A100]).

3 General Considerations

The major design goals of this specification are simplicity, extensibility and efficiency. This specification seeks to accomplish these goals whenever possible by leveraging other standards. It also seeks to accomplish these goals in a manner that is neutral as to the platform any particular actor may be using to participate in interactions governed by this specification.

3.1 Related Standards

This specification seeks to leverage both existing and emerging web service standards whenever possible. The following are particularly noted as relevant standardization efforts:

3.1.1 Existing Standards

WSDL – Defines how abstract interfaces and their concrete realizations are defined.

Schema – Defines how types are defined and associated with each other.

Namespaces – Defines how XML Namespaces are declared and used.

SOAP – Defines how to invoke web service interfaces.

SSL/TLS – Defines secure transport mechanisms.

URL – Defines URI (includes URL) syntax and encoding

Character Sets - Character set encoding

XML Digital Signatures – Defines how portions of an XML document are digitally signed.

SAML – Defines how authentication and authorization information may be exchanged.

WS-I.org – Has defined a base profile for use of the WSDL, SOAP and UDDI web services standards such that interoperability is maximized.

XACML – Defines syntax for expressing authorization rules.

P3P – Defines how a Producer/Portlet may publish its privacy policy so that a Consumer could enforce End-User privacy preferences.

3.1.2 Emerging Standards

XML Encryption – Defines how to encrypt/decrypt portions of an XML document.

WS-Security – Defines how document level security standards apply to SOAP messages.

RLTC – Defines syntax for expressing authorization rules.

XCBF – Defines how to exchange biometric data.

WS-Attachments - Defines how to encapsulate a SOAP message and zero or more attachments within a DIME message.

WS-I.org - Defining additional profiles (e.g. Security) for use of web services standards such that interoperability is maximized.

DIME – A lightweight, binary message format that encapsulates one or more resources in a single message construct.

JSR168 – Java Community Process effort defining the Java Portlet Specification.

3.2 Foundations

As a specification that enables aggregating applications to use generic proxy code to easily integrate compliant web services, the foundations for the specification become critical. The text of this specification uses an IDL-like syntax to describe the interface in a non-normative manner. The ONLY normative description of the interface itself is contained in the WSDL referenced by section 18. The textual portion of this specification does not contain normative statements regarding the exact syntax of XML passed between Consumer and Producer, but it does contain normative statements about the manner and order in which calls must be made in order to be conformant. The chapters below are organized along the lines of the portTypes defined in the WSDL and the IDL descriptions of the data types reflect the normative schema definitions from the WSDL.

3.3 Data Objects

It is often necessary to pass data to operations. Typed data objects are defined as the transport mechanism wherever possible. The schema definitions of these structures includes the <any namespace="##other"/> construct as a standard means for data extensions. Producers/Portlets employing these extensions are encouraged to provide typing information for the extended data items [A505]. The preferred means for this typing information includes using the schema defined[3] "type" attribute to reference the correct schema on each such extension element, and use of

[3] http://www.w3.org/TR/xmlschema-1/#xsi_type

either the Producer's WSDL (default) or a "schemaLocation" attribute as per standard schema usage to declare the details of all non-simple types. This allows Consumers to provide type checking outside of that done by typical interface layers. This specification introduces various data structures as they are needed for operations and has a list of all these data structures in Appendix C.

3.4 Lifecycles

"Lifecycle" is a term used to describe how items become available, are interacted with, and finally are destroyed. The two lifecycles included in this specification are:

Persistent: This lifecycle starts with an explicit operation to create the item and ends only with an explicit operation to destroy the item. Examples include the `registrationHandle` and Consumer Configured Portlets.

Transient: This lifecycle can either start with an explicit operation OR as a side effect of some other operation [A204]. The item created is transient and no explicit operation is required to destroy it. This specification generally includes an `expires` element when a transient item is created so that any resources at the Consumer related to the item may be reclaimed at an appropriate time. An example of this is session creation.

3.5 Scopes

Scope is a term used to describe when something is valid. An item often scopes both the usage and lifecycle of other items. Scopes that are referenced in this specification are:

Registration scope: This scope is initiated when a Consumer registers with a Producer and ends when the handle referring to that registration is released. As such it encompasses any Portlets the Consumer configures and any interactions with the Portlets of the Producer. From the Producer's perspective, this scope has a persistent lifecycle. This scope is referenced throughout the protocol using a `registrationHandle`. The `registrationHandle` is created and destroyed using either in band mechanism, i.e. by declaring support for the `Registration` portType, or by out of band mechanism, whereby the `registrationHandle` is created and destroyed by means outside this specification. If a Producer supports the `RegistrationLifetime` portType, then this scope can also be ended in a scheduled manner.

Portlet scope: This scope is initiated for a Producer Offered Portlet when the portlet is added to the set returned in the metadata of the Producer. This scope is initiated for a Consumer Configured Portlet when the Portlet is cloned and as such will be encapsulated by a registration scope. This scope ends for Consumer Configured Portlets when the reference to the Portlet is explicitly released or, if the Producer supports the `PortletLifetime` portType, released in a scheduled manner. As such it encompasses all interactions with the Portlet. This scope has a persistent lifecycle and is referenced using a `portletHandle`. The Producer optionally exposes this scope by declaring support for the `PortletManagement` portType. If the Producer exposes the `PortletManagement` portType, then the Consumer can clone the Producer Offered Portlets and uniquely configure them for its own use. The Consumer can also choose to directly use the Producer Offered Portlets.

Session scope: This scope is initiated when a Portlet needs to store transient state on the Producer and is always encapsulated by the Portlet's scope. This scope ends when the session holding that state is released (either via an explicit operation on the Producer OR via a timeout mechanism). As such it encompasses a set of operation invocations in which the Consumer has supplied the session handle. This scope has a transient lifecycle and is established by the Producer returning a new `SessionContext`. The Consumer MUST respect this new session scope as described in section 6.1.1.

3.6 Types of Stateful Information

Because the WSRP protocol operates over connectionless technologies, the Producer must be able to return information to the Consumer, with the understanding that this information will be sent back to it [A200]. Three types of stateful information exist:

Navigational state: This is the state that allows the current page fragment to be correctly generated multiple times. Web applications typically store this type of state in the URL so that both page refresh and bookmarked pages will generate what the End-User expects. The Producer returns this state to the Consumer as `navigationalState` such that it may satisfy these expectations of the End-User. To supply the bookmarking and page refresh capabilities End-Users expect, the Consumer MAY store this state, or a reference to it, in the URL.

Transient state: This is state that applies to a restricted set of operations. This specification defines two kinds of transient state; namely:

> **Interaction State:** This state is supplied to the processing of an interaction with a Portlet's markup and is often used as the equivalent of input parameters to that processing.
>
> **Session State:** This state is stored on the Producer and is related to a sequence of operations (for example, an e-Commerce site may store a shopping cart in its transient state). Once a session is generated, the Producer returns a reference to it and the Consumer must return this reference on future invocations as described in section 6.1.2. This type of state will be referred to as a **Session** (similar to an HTTP Session) and an opaque reference to one is a `sessionID`.

Persistent state: This is state that is persisted until either the Consumer or Producer explicitly discards it. This specification defines two kinds of persistent state with each referred to via a handle that MUST remain invariant once the Producer supplies it to the Consumer:

> **Consumer Registration:** Represents a relationship between a Consumer and Producer (also a registration scope). Data that is part of the Consumer registration state impacts all invocations within the scope of the registration. The opaque reference to Consumer registration state is referred to as a `registrationHandle`**.**
>
> **Portlet:** In addition to the Portlets a Producer offers for all Consumers to use, the ability of a Consumer to create a unique configuration of one of those Portlets for its own use is defined. The opaque reference to a configured Portlet is referred to as a `portletHandle` (also correlates to a Portlet scope).

3.7 Persistence and Statefulness

This specification does not mandate that either the Producer or the Consumer is stateful [A201]. In the **getMarkup** and **performBlockingInteraction** calls, the `navigationalState` field carries the state necessary for the Portlet to render the current markup to be returned to the Consumer. This enables the Consumer to reasonably support page refresh and bookmarking by the End-User. If the Producer utilizes local state, storing this state in an implementation-dependent manner, then it will return a `sessionID` to the Consumer for use during the lifetime of the session.

If the Consumer is operating in a stateless manner, then it may choose the way to achieve this. In the case of HTTP transport the Consumer may employ standard HTTP mechanisms (cookies or URL-rewriting) to propagate the navigational state or `sessionID` out to its client. If operating in a stateful manner, the Consumer may employ any number of persistence/caching mechanisms [A202].

The nature of the conversation between the client and the Consumer, for purposes of this section, is out of scope [A304]. This does not mean that information about the client, including user profile

data, is opaque to the Producer. There are many use cases for which user identity must be conveyed to the Producer [A501][A606].

3.8 Producer Mediated Sharing

Producers may implement a sharing mechanism through techniques such as a shared area within sessions for Portlets to use. The Producer indicates which Portlets share such data areas via the `groupID` parameter in the Portlet metadata. Section 5.1.19 specifies how the Consumer is to process Producer's grouping, which are defined by the groupID parameters.

Shared data areas introduce implementation challenges in clustered environments. In such an environment, multiple concurrent requests may be routed to different cluster nodes. The Producer must ensure that Portlets with a common shared data area have access to the shared data even in such situations.

3.9 Consumer Mediated Coordination

Consumers may implement mechanisms through which portlets react in a coordinated manner. This specification defines two such mechanisms:

1. Event Distribution: This mechanism provides for portlets generating and consuming events that carry both semantic meaning through their name and data in their payload. In addition, Consumers can also generate events for distribution to portlets. All events are distributed by the Consumer such that any current portlet state which is stored at the Consumer can be supplied along with the event to the Portlet. This also allows the Consumer to apply whatever policies it chooses to control the event distribution.
2. Public Parameters: This mechanism is an extension to the Portlet's state which is stored and managed by the Consumer and supplied to the Portlet on each invocation.

3.10 Information Passing Mechanisms

All information passing enabled by this specification is between exactly one Producer and one Consumer. Implementation of data sharing, including both policy and side effects, within a particular Producer service is outside the scope of this specification.

3.11 Three-step protocol

This specification attempts to account for both isolated interactions between a Consumer and a Producer, and also those interactions that may cause state changes in other Portlets the Consumer aggregates from the same Producer [A503]. Common causes of such shared state include use of a common backend system (e.g. database) and Producer-mediated data sharing. In addition, the Consumer can selectively distributing events, including ones it generates itself, among the Portlets. For these reasons, there is a "three-step" capability built into the protocol. Note that this is a backward compatible extension of the WSRP v1 two-step protocol as the additional step, event distribution, is entirely optional.

The first two steps of any interaction that gathers new markup from Portlets are optional. In the first step, the Consumer invokes **performBlockingInteraction** on the Portlet whose markup the End-User interacted with. The Consumer MUST NOT invoke operations on any Portlets within the context of the initiating request from the client of the Consumer until either the receipt of a response or the invocation of **performBlockingInteraction** fails (e.g. times out). In the second step, the Consumer has the option of distributing events among the Portlets. Note that the Consumer could distribute multiple events to a portlet in this step, but is restricted from sending additional events while the portlet is processing an event (see section 6.4.2.1). The third step occurs when the Consumer invokes **getMarkup** on the Portlets being aggregated. Examples of when the first two steps might not be used include:

- The End-User interacting with a url that simply looks to render the portlet's markup with a different navigational state (e.g. with the next set of results from a search). In this case, both of the first two steps could be skipped.
- The initial page construction for the End-User. This may involve the Consumer distributing events (step two) in order to initialize a portlet's state, but should not involve the first step as the End-User has not interacted with the portlet's markup (Note that a bookmarked page could be an exception to this, but that the bookmarked interaction is unlikely to have the same impact as during the session when the bookmark was generated).

Interaction semantics are well-defined across the spectrum of interaction styles supported in the protocol. In other words, the results of the Consumer invoking **performBlockingInteraction** on a Portlet and distributing events among the Portlets, regardless of whether those interactions have side effects on other Portlets at the Producer, is well-defined independent of the order of **getMarkup** invocations on the Portlets.

3.12 Transport Issues

Since the transport layer is often used to store various pieces of information (e.g. J2EE load balancing depends on a session cookie and HTTP transport), and these pieces of information often will pertain to a client session with the Consumer rather than the Consumer itself, Consumers that manage transport layer issues, such as cookies, MUST return them to the Producer only for subsequent invocations within the Markup Interface during the same client session. In addition, any supplying of cookies to resources the portlet references needs to be in conformance with the rules established by RFC2109[4]. Not scoping their return in this manner will likely result in a loss of privacy for the End-User and unexpected behavior in general. Failure to return them for this full duration will often result in a loss of state at the Producer and unexpected behavior for the End-User. We also note that failure to properly do this management will eliminate the ability to use Producers that set `requiresInitCookie` to a value other than "`none`".

3.13 Load Balancing

Load balancing is a part of the Producer environment that cannot easily be managed from within the protocol. Load balancing is highly dependent on mechanisms in the transport, for example the use of cookies in HTTP. In order to permit load balancing to function, regardless of the transport binding in use, the Consumer needs to manage transport level issues itself. Using HTTP as an example, if the Producer requires such support of Consumers, it MUST indicate so by setting the `requiresInitCookie` metadata to a value other than "`none`". If the Producer set `requiresInitCookie` to a value other than "`none`", the Consumer MUST ensure that cookies are properly supplied in subsequent requests for the End-User.

[4] http://www.ietf.org/rfc/rfc2109.txt

4 Interface Overview

This specification defines four interfaces whose operations have the following signatures:

4.1 Service Description Operations

The Service Description interface, a required interface, defines an operation for acquiring the Producer's metadata.

```
ServiceDescription = getServiceDescription(RegistrationContext,
                                           desiredLocales);
```

4.2 Markup Operations

The Markup interface, a required interface, defines operations for getting the markup from a Portlet as well as processing user interactions with that markup. This interface also contains the operation for Consumer assistance in pre-initializing HTTP cookies. Having this operation in this interface avoids the problems associated with moving cookies between bindings.

```
MarkupResponse = getMarkup(RegistrationContext, PortletContext,
                           RuntimeContext, UserContext, MarkupParams);
```

```
MarkupResponse = getResource(RegistrationContext, PortletContext,
                             RuntimeContext, UserContext,
                             ResourceParams, MarkupParams);
```

```
BlockingInteractionResponse = performBlockingInteraction(
                                    RegistrationContext,
                                    PortletContext, RuntimeContext,
                                    UserContext, MarkupParams,
                                    InteractionParams);
```

```
HandleEventsResponse = handleEvents(RegistrationContext,
                           PortletContext, RuntimeContext, UserContext,
                           MarkupParams, InteractionParams, Event[]);
```

```
ReturnAny = initCookie(RegistrationContext);
```

```
ReturnAny = releaseSessions(RegistrationContext, sessionIDs);
```

4.3 Registration Operations

The Registration interface, an optional interface, defines operations for establishing, updating and destroying a registration. Each registration reflects a particular relationship between a Consumer and a Producer.

```
RegistrationContext = register(RegistrationData);
```

```
RegistrationState = modifyRegistration(RegistrationContext,
                                       RegistrationData);
```

```
ReturnAny = deregister(RegistrationContext);
```

4.4 Portlet Management Operations

The Portlet Management interface, an optional interface, defines operations for getting Portlet metadata, cloning Portlets for further customization and interacting with the property interface.

```
PortletDescriptionResponse=getPortletDescription(RegistrationContext,
                                   PortletContext, UserContext,
                                   desiredLocales);
```

```
PortletContext = clonePortlet(RegistrationContext, PortletContext,
                              UserContext, Lifetime);
```

```
DestroyPortletsResponse = destroyPortlets(RegistrationContext,
                                          portletHandles);
```

```
PortletContext = setPortletProperties(RegistrationContext,
                         PortletContext, UserContext, PropertyList);
```

```
PropertyList = getPortletProperties(RegistrationContext,
                                    PortletContext, UserContext, names);
```

```
PortletPropertiesDescriptionResponse = getPortletPropertyDescription(
                                          RegistrationContext,
                                          PortletContext, UserContext,
                                          desiredLocales)
```

4.5 CopyPortlet Operations

The CopyPortlet interface, an optional interface, defines an operation for generating new Portlets based on existing Portlets, including those in other registrations.

```
CopyPortletsResponse = copyPortlets(toRegistrationContext,
                                    toUserContext,
                                    fromRegistrationContext,
                                    fromUserContext,
                                    fromPortletContexts[],Lifetime);
```

4.6 ImportExport Operations

The ImportExport interface, an optional interface, defines operations for generating representations of Portlets which can be used to constitute new Portlet, including from Consumers other than the one which requested the representation.

```
ExportPortletsResponse = exportPortlets(RegistrationContext,
                                        PortletContext[]
                                        UserContext,
                                        ExportByValueRequired,
                                        Lifetime);
```

```
ImportPortletsResponse = importPortlets(RegistrationContext,
                                        ImportContext,
                                        ImportPortlet[],
                                        UserContext, Lifetime);
```

```
ReturnAny = releaseExport(ExportContext);
```

```
Lifetime = setExportLifetime(RegistrationContext, ExportContext,
                             Lifetime);
```

4.7 Registration Lifetime Operations

The Registration Lifetime interface, an optional interface, defines operations for getting and setting the scheduled destruction of a registration.

```
Lifetime = getRegistrationLifetime(RegistrationContext);
```

```
Lifetime = setRegistrationLifetime(RegistrationContext, Lifetime);
```

4.8 Portlet Lifetime Operations

The Portlet Lifetime interface, an optional interface, defines operations for getting and setting the scheduled destruction of a Portlet.

```
Lifetime = getPortletLifetime(RegistrationContext, PortletContext);
```

```
Lifetime = setPortletLifetime(RegistrationContext, PortletContext,
                              Lifetime);
```

5 Service Description Interface

A Producer may be discovered through mechanisms such as **[UDDI]*~~[UDDI]~~*** or ***[ebXML Registry]***, which also provide information concerning the capabilities of the service. Other discovery mechanisms (e.g. emailed URL to a properly enabled user-agent) do not expose these capabilities. The **getServiceDescription** operation provides a discovery mechanism-agnostic means for a Consumer to ascertain a Producer's or Portlet's capabilities [A110]. This interface is required of all Producers to provide a well-defined means for Consumers to ascertain the requirements to register or use the Producer.

5.1 Data Structures

The normative definitions for all data structures are contained in the WSDL referenced in section 18. For the convenience of the reader, this non-normative section uses an IDL like syntax to describe these structures, where the leading [R] indicates a field is required and [O] indicates it is optional. The operations in this section introduce the following data structures:

5.1.1 Extension Type

The `Extension` structure contains the payload extension mechanism for vendor and application extensions. This allows arbitrary elements from other namespaces to be sent as part of containing data structures. They are designed to communicate extended information between the Consumer and Producer. Consumers and Producers SHOULD NOT rely on receiving back any extensions passed to or returned from an invocation. Each such extension element carries a single child element which MUST declare its type using the schema-defined "type" attribute[5]. We RECOMMEND extensions either be of type `xsd:string` (where xsd stands for http://www.w3c.org/2001/XMLSchema) or be of a type defined in the Producer's WSDL as this enables Consumers to prepare an appropriate serializer/deserializer. We expect many extensions will be of the type `NamedString` and encourage its reuse in this manner. The other option is for each message to connect the extension to a type declared in a schema using the "schemaLocation" attribute as used by schema. Consumers and Producers are NOT REQUIRED to process information supplied using these extension elements.

```
Extension
  [O] Object    any
```

Members:

- `any`: This field has a schema declaration that allows any elements from namespaces other than WSRP. While the element definitions for these extensions are required to be in a namespace other than the WSRP types namespace, the use of the types defined within the XML Schema and WSRP ext*ra~~ension~~* namespace is encouraged as this increases the likelihood of the receiving partner being able to deserialize the extension in a useful manner. Overlap with the fields defined in the structure SHOULD be voided.

5.1.2 Handle Type

Handles are opaque references that are passed between the Consumer and Producer.

Handles are represented as restricted strings in the protocol. Although a string is principally unlimited in length, the length of the handle is restricted for the following reasons:

- Handles may be stored in databases and may be used for indexing.

[5] http://www.w3.org/TR/xmlschema-1/#xsi_type

- The Consumer will likely embed handles in client URLs.
- Comparison of handles should be efficient.

The maximum length of a handle is restricted to 255 characters. We STRONGLY RECOMMEND these characters be chosen from the first 127 characters of the Unicode character set so that it is feasible to represent the value in no more than 255 bytes of storage. Not following this recommendation will likely cause information to be lost as the Consumer stores and retrieves the value. The Consumer MAY truncate longer handles to 255 characters.

```
Handle extends string (maximum length = 255)
```

5.1.3 Key Type

Keys are similar to Handles except that they are not opaque references. They are used for keying data and therefore need to support efficient comparisons. As a result their length is restricted to 255 characters. We STRONGLY RECOMMEND these characters be chosen from the first 127 characters of the Unicode character set so that it is feasible to represent the value in no more than 255 bytes of storage. Not following this recommendation will likely cause information to be lost as the value is stored and retrieved.

```
Key extends string (maximum length = 255)
```

5.1.4 ID Type

IDs are used to refer to something, but are unlikely to be used as keys. As a result the length restriction is relaxed to 4096 characters. We STRONGLY RECOMMEND these characters be chosen from the first 127 characters of the Unicode character set so that it is feasible to represent the value in no more than 4096 bytes of storage. Not following this recommendation will likely cause information to be lost as the value is stored and retrieved. Those originating an ID are encouraged to keep them as small as possible relative to impacts on the other party's performance when storing large numbers of these (e.g. a sessionID is per user per Portlet and therefore a Consumer is likely to store a very large number of them).

```
ID extends string (maximum length = 4096)
```

5.1.5 LocalizedString Type

This `LocalizedString` structure describes both the value for a particular locale and the resource name that can be used to extract the value for other locales from a `ResourceList`.

```
LocalizedString
  [R] string    xmlLang
  [R] string    value
  [O] string    resourceName
```

Members:

- `xmlLang`: The locale for this supplied localized value. This is carried in the WSDL using the `xml:lang` attribute.
- `value`: The value for this localized string in the declared locale.
- `resourceName`: The name assigned to this localized string for dereferencing into a `ResourceList` for values from other locales. When the `resourceName` is not supplied, there are no values for additional locales available in the ResourceList.

5.1.6 ResourceValue Type

This structure provides the value of a resource for a locale.

```
ResourceValue
  [R] string    xmlLang
  [R] string    value
  [O] Extension extensions[]
```

Members:

- `xmlLang`: The locale for this localized value. This is carried in the WSDL using the `xml:lang` attribute.
- `value`: The value for this localized string in the declared locale.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.7 Resource Type

The `Resource` structure carries the values for a resource in a set of locales.

```
Resource
  [R] string          resourceName
  [R] ResourceValue   values[]
  [O] Extension       extensions[]
```

Members:

- `resourceName`: The name of the resource for which this is a list of localized values.
- `values`: Each member of this array provides the value for the resource in a locale.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.8 ResourceList Type

This is an array of `Resource` structure, each of which carries the values for a localized resource in various locales.

```
ResourceList
  [R] Resource  resources[]
  [O] Extension extensions[]
```

Members:

- `resources`: Each member of this array provides the localized values for a resource.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.9 ItemDescription Type

This structure is used to describe custom items a Consumer is allowed to use when interacting with the Portlets at the Producer.

```
ItemDescription
  [R] string          itemName
  [R] LocalizedString description
  [O] Extension       extensions[]
```

Members:

- `itemName`: The name for this item. The preferred form is a URI such that it is definitively namespaced.
- `description`: A localized, free form description of the item. Expected use of this field is for display at the Consumer to someone who will provide a mapping to Consumer information.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.10 MarkupType Type

The `MarkupType` data structure is used to carry Portlet metadata that is `mime type` specific.

```
MarkupType
  [R] string    mimeType
  [R] string    modes[]
  [R] string    windowStates[]
  [O] string    locales[]
  [O] Extension extensions[]
```

Members:

- `mimeType`: A mime type supported by the Portlet (e.g. *text/html, application/xhtml+xml, text/vnd.wap.wml*) for which the remainder of this structure applies. In addition to these fully specified mime types, use of "*" (indicates all mime types are supported) and type/* (where type includes things such as "text") from the HTTP definition[6] MAY be specified. The Consumer does not have to process any optional parameters that can be included on mime type declarations.
- `modes`: The modes (defined in section 6.9) that are supported by the Portlet for this `mimeType`.

  Possible values are:

  - those defined by this specification in section 6.9;
  - modes supplied by the Consumer in `consumerModes`;
  - any custom modes the Producer wishes to advertise as valid (see section 6.9.5).

  Localized descriptions are only needed for the last category since the first two do not require manual interpretation.
- windowStates: The `windowStates` (defined in section 6.10) that are supported by the Portlet for this `mimeType`.

  Possible values are:

  - those defined by this specification in section 6.10;
  - window states supplied by the Consumer in `consumerWindowStates`;

[6] http://www.ietf.org/rfc/rfc2616.txt

- any custom window states the Producer wishes to advertise as valid (see section 6.10.5).

Localized descriptions are only needed for the last category since the first two do not require manual interpretation.

- locales: An optional array of locales for which this `mimeType` is available (e.g. “en-US”). If this array is not supplied, the Consumer can assume the Portlet will attempt to generate markup for any requested locale. Note that current practice on the Internet uses the format [2 char language code][7] “-” [2 char country code][8] as per the provided example. Values only using a two character language code mean that the Portlet is willing to generate markup of this type for any locale starting with the specified language code.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.11 EventDescription Type

The `EventDescription` structure provides the information needed to describe a Portlet’s events.

```
EventDescription
  [R] QName           name
  [R] QName           type
  [O] LocalizedString description
  [O] LocalizedString label
  [O] LocalizedString hint
  [O] boolean         requiresSecureDistribution
  [O] Extension       extensions[]
```

Members:

- `name`: A namespaced name for the event being described.
- `type`: A reference to a schema-defined payload the event will carry at runtime.
- `description`: A localized, free form description of the event. Expected use of this field is for display at the Consumer to someone who will choose how this event is mapped to other events.
- `label`: A short, human-readable name for the event. Intended purpose is for display in any Consumer-generated user interface for processing/distributing the event.
- `hint`: A relatively short description of the event. Intended for display (for example, as a tooltip) in any Consumer-generated user interface for processing/distributing the event.
- `requiresSecureDistribution`: This boolean (default value is ‘false’) indicates whether or not the described event requires a secure communication channel in order to be distributed. This is generally used if the event payload contains sensitive information that should not be exposed in an indiscriminate manner. This setting MUST be respected by the Consumer even when portions of the information are distributed in manners other than distributing the portlet generated event.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

Since an event’s name can be refered to in a wildcard fashion (see section 2.1.2), Portlet developers are encouraged to organize their event names in a hierarchical nature. An example of such an organization would be events carrying changed address information on an application being organized as “applicant/address/streetChanged”, “applicant/address/cityChanged”, etc..

[7] http://lcweb.loc.gov/standards/iso639-2/langcodes.html
[8] http://www.din.de/gremien/nas/nabd/iso3166ma/codlstp1/en_listp1.html

Such an organization would allow another portlet's metadata to simply say that it is interested in all events starting with "applicant/address/". The use of the "/" character to denote levels within such a hierarchy is suggested as a means to enable easier reading of these hierarchical event names, but should not be taken to imply that the event names are treated as XPaths since they in general are not XPaths.

5.1.12 PortletDescription Type

The `PortletDescription` structure contains a set of fields that provide the metadata to describe the Portlet as well as any clones of the Portlet.

```
PortletDescription
  [R] Handle                 portletHandle
  [R] MarkupType             markupTypes[]
  [O] ID                     groupID
  [O] LocalizedString        description
  [O] LocalizedString        shortTitle
  [O] LocalizedString        title
  [O] LocalizedString        displayName
  [O] LocalizedString        keywords[]
  [O] QName                  publishedEvents[]
  [O] QName                  handledEvents[]
  [O] PropertyDescription    publicParameterDescriptions[]
  [O] string                 userCategories[]
  [O] string                 userProfileItems[]
  [O] boolean                usesMethodGet
  [O] boolean                defaultMarkupSecure
  [O] boolean                onlySecure
  [O] boolean                userContextStoredInSession
  [O] boolean                templatesStoredInSession
  [O] boolean                hasUserSpecificState
  [O] boolean                doesUrlTemplateProcessing
  [O] Extension              extensions[]
```

Members:

- `portletHandle`: The handle by which Consumers can refer to this Portlet. Note that Handles are restricted to a maximum length of 255 characters.
- `markupTypes`: Each member of this array specifies metadata for a single `mimeType`.
- `groupID`: Identifier for the group within which the Producer places this Portlet or any Portlets derived from it via the cloning process.
- `description`: Localized descriptions of the Portlet. This is intended for display in selection dialogs, etc.
- `shortTitle`: Localized short title for the Portlet.
- `title`: Localized title for the Portlet. This value is intended for display in a titlebar decoration for the Portlet's markup.
- `displayName`: Localized value intended for display in a Consumer's tooling for building aggregated page. In general this value is shorter than either title, though the available title values can be used as a default if this value is missing.
- `keywords`: Array of localized keywords describing the Portlet which can be used for search, etc.
- `publishedEvents`: This array provides the event names for the events the portlet could generate. Each name specified is allowed to end with a "*" character to indicate the portlet could publish any event whose name starts with the characters before the "*" character. While Portlets are allowed to generate events that are not described in this array, the information such events contain will not distributed by Consumers requiring explicit wiring of events.

- `handledEvents`: This array provides the event names the portlet is willing to process. Each name specified is allowed to end with a "*" character to indicate the portlet is willing to process any event whose name starts with the characters before the "*" character.
- `publicParameterDescriptions`: Array of descriptions for the items a portlet wishes to receive as publicParameters. While `publicParameterDescriptions` reuse the `PropertyDescription` type, it is always a Consumer choice as to whether or not to supply them on a particular invocation. As such, regardless of the values in the `PropertyDescription`'s `capabilities` field, `publicParameters` are always modifiable and optional,
- userCategories: Array of category names for the Producer's user categories that the Portlet supports. Each of these user categories has to have a ItemDescription available to the Consumer through the Producer's ServiceDescription. [R416]
- userProfileItems: An array of strings that enumerate what portions of the UserContext structure the Portlet needs to provide full functionality. For the fields this specification defines, the named profile items a Portlet uses MUST all come from the "Profile Name" column of the table found in section 15. Any use of additional userProfile items specified as available when the Consumer registered SHOULD use the names the Consumer supplied. Any additional items specified SHOULD be interpreted by the Consumer as additional items the Portlet could use if the Consumer is able to supply the data.
- `usesMethodGet`: A flag indicating the Portlet generates markup that uses method=get in an HTML form. If the Consumer uses a Portlet which specifies `usesMethodGet` as "true", the Consumer MUST format its URLs in a manner that keeps user-agents from throwing away information (see section 14.2.4 for a description of the difficulties in using forms with method=get). The default value of this flag is "`false`".
- `defaultMarkupSecure`: Flag that indicates whether this Portlet requires secure communication on its default markup. This flag applies to all markup not generated as a direct result of an End-User interaction. The default value for this flag is "false".
- `onlySecure`: Flag that indicates whether this Portlet requires secure communication on all its markup. The intent of this flag is to allow Consumers to treat the Portlet specially because of this characteristic. The default value for this flag is "false".
- `userContextStoredInSession`: A flag indicating the Portlet will store any supplied `UserContext` in the current session. Setting this flag to "`true`" allows the Consumer to optimize when the `UserContext` is included on operation invocations. Since some data in the `UserContext` is sensitive, many Consumers will require that secure communication be used when the information is passed. Not requiring this of all invocations can result in a significant performance difference. Note that the Consumer MAY send `UserContext` information on any invocations as a replacement for information the Portlet MAY be storing in a session. The default value of this flag is "`false`".
- `templatesStoredInSession`: A flag indicating the Portlet will store any supplied `templates` in the current session. Setting this flag to "`true`" allows the Consumer to optimize when the `templates` structure is set in `MarkupParams`. Since the content of the `templates` structure can get quite large, not requiring it to be passed can result in a significant performance difference. Note that the Consumer MAY send templates on any invocations as a replacement for information the Portlet MAY be storing in a session. The default value of this flag is "`false`".
- `hasUserSpecificState`: A flag indicating the Portlet will store persistent state specific to each End-User. Setting this flag to "`true`" suggests to the Consumer to clone the Portlet when placing it on an aggregated page rather than waiting for the processing described in section 6.4.2.1. The default value of this flag is "`false`".

- `doesUrlTemplateProcessing`: A flag indicating the Portlet will process any `templates` supplied so as to correctly write URLs in its markup. For Portlets setting doesUrlTemplateProcessing to "`true`", Consumers MUST provide the URL writing templates and `namespacePrefix` field. The default value of this flag is "`false`".
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.13 Property Type

The `Property` data structure is used to carry typed information between the Consumer and the Producer.

```
Property
  [R] string   name
  [O] string   xmlLang
  [O] Object   value[]
```

Members:

- `name`: Name of the property, MUST have a non-zero length.
- `xmlLang`: The locale for the supplied localized value. This is carried in the WSDL using the `xml:lang` attribute.
- `value`: The property's value. The type information needed to properly serialize / deserialize this value is carried in the relevant `PropertyDescription`. Note that the WSDL from section 18 defines two means by which this field may be sent, either as a generic array of elements or as a single element with a type of string. This second choice was added as many properties are likely to be of this type and it allows the web stack to automatically do the (de)serializing to the wire format.

5.1.14 ResetProperty Type

The `ResetProperty` data structure carries the name of a Property for which the Consumer wants the value reset to the default.

```
ResetProperty
  [R] string   name
```

Members:

- `name`: Name of the property whose value is to be reset; MUST have a non-zero length.

5.1.15 PropertyList Type

A `PropertyList` gathers a set of Property structures together for transmitting between the Consumer and Producer.

```
PropertyList
  [O] Property        properties[]
  [O] ResetProperty   resetProperties[]
  [O] Extension       extensions[]
```

Members:

- `properties`: Each member in this array is a `Property` structure carrying information concerning one property.
- `resetProperties`: Each member in this array is a `ResetProperty` structure carrying a property to reset to its default value.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

It is an error for a `property` to be referenced by both the `properties` and `resetProperties` arrays. The Producer MUST return an `InvalidParameters` fault message if the Consumer supplies a `property` in both the `properties` and `resetProperties` array of a `PropertyList`.

5.1.16 PropertyDescription Type

Each property of a Portlet is described using the following structure.

```
PropertyDescription
  [R] string          name
  [R] QName           type
  [O] LocalizedString label
  [O] LocalizedString hint
  [O] string          capabilities[]
  [O] Extension       extensions[]
```

Members:

- `name`: Name of the property being described, MUST have a non-zero length.
- `type`: Type of the property. For those not familiar with the QName type, we note that this is a namespace qualified name. We would encourage these to either be from the set of schema-defined types or be explicitly typed in the schema element of an enclosing `ModelDescription`. This allows the Consumers to prepare the appropriate serializer/deserializer. The namespace for the schema-defined types used by this specification is http://www.w3c.org/2001/XMLSchema. Producers can assume that all Consumers support the basic types defined by http://www.w3c.org/TR/xmlschema-2/.
- `label`: A short, human-readable name for the property. Intended purpose is for display in any Consumer-generated user interface for administering the Portlet.
- `hint`: A relatively short description of the property. Intended for display, for example, as a tooltip in any Consumer-generated user interface for editing the property.
- `capabilities`: An array of capabilities with the following definitions providing a start on sensible values:
  - `nonmodifiable`: This capability means the Consumer is not allowed to change the property. If this term is not specified, the user of the property may presume the right to change the property's value.
  - `required`: This capability means that the user has to supply a value for this property. If this capability is not set, the user of the property may choose whether or not to supply a value.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.17 ModelTypes Type

The `ModelTypes` structure contains the payload mechanism for declaring the types referenced by the `PropertyDescriptions` of a `ModelDescription`.

```
ModelTypes
  [R] Object    any[]
```

Members:

- `any`: This field has a schema declaration that allows any elements from the schema namespace.

5.1.18 ModelDescription Type

The set of properties of a Portlet are described in its metadata using the following structure.

```
ModelDescription
  [O] PropertyDescription    propertyDescriptions[]
  [O] ModelTypes             modelTypes
  [O] Extension              extensions[]
```

Members:

- `propertyDescriptions`: Array of property descriptions.
- `modelTypes`: A container for type definitions for the properties of this model. It is expected that XML schema will commonly be used to define Portlet-specific datatypes referenced in the `propertyDescriptions`.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.19 CookieProtocol Type

This type is a restriction on the string type that is constrained to the values “`none`”, “`perUser`” or “`perGroup`”. These values carry the following semantics:

- ”`none`”: The Producer does not need the Consumer to ever invoke **initCookie**.
- ”`perUser`”: The Consumer MUST invoke **initCookie** once per user of the Consumer, and associate any returned cookies with subsequent invocations on behalf of that user.
- ”`perGroup`”: The Consumer MUST invoke **initCookie** once per unique `groupID` from the `PortletDescriptions` for the Portlets it is aggregating on a page for each user of the Consumer, and associate any returned cookies with subsequent invocations on behalf of that user targeting Portlets with identical `groupIDs`.

5.1.20 ServiceDescription Type

The `ServiceDescription` structure contains a set of fields that describe the offered services of the Producer.

```
ServiceDescription
  [R] boolean                requiresRegistration
  [O] PortletDescription     offeredPortlets[]
  [O] ItemDescription        userCategoryDescriptions[]
  [O] ItemDescription        customUserProfileItemDescriptions[]
  [O] ItemDescription        customWindowStateDescriptions[]
  [O] ItemDescription        customModeDescriptions[]
  [O] CookieProtocol         requiresInitCookie
  [O] ModelDescription       registrationPropertyDescription
  [O] string                 locales[]
  [O] ResourceList           resourceList
  [O] EventDescription       eventDescriptions[]
  [O] boolean                supportsExportByValue
  [O] integer                recommendedExportSizse
  [O] Extension              extensions[]
```

Members:

- `requiresRegistration:` A boolean indicating whether or not the Producer requires Consumer registration. If `requiresRegistration` is set to "false" then it MUST be valid to not pass a `RegistrationContext` parameter to all operations with this parameter. If `requiresRegistration` is set to "true" then the Producer MUST return a fault message when no `RegistrationContext` is supplied to an operation, other than **getServiceDescription,** which takes this field.
- `offeredPortlets:` An array of structures (defined in Section 5.1.12) containing the metadata for the Producer Offered Portlets.
- `userCategoryDescriptions:` An array of `ItemDescription` structures as defined in Section 5.1.9. This array includes entries for every user category the Producer is willing to have the Consumer assert for an End-User, including the user category names defined in section 1B.1 of this specification. Note that user categories are Producer-wide and therefore are inherently shared by the Producer's Portlets.
- `customUserProfileItemDescriptions:` An array of `ItemDescription` structures as defined in Section 5.1.9. This array MUST include an entry for any user profile item the Producer supports which is not defined by this specification.
- `customWindowStateDescriptions:` An array of `ItemDescription` structures as defined in Section 5.1.9. This array MUST include an entry for any custom window state the Producer supports.
- `customModeDescriptions:` An array of `ItemDescription` structures as defined in Section 5.1.9. This array MUST include an entry for any custom mode the Producer supports.
- `requiresInitCookie:` A string (default value = "`none`") indicating whether or not the Producer requires the Consumer to assist with cookie support of the HTTP protocol.
- `registrationPropertyDescription:` Property descriptions for information the Consumer needs to supply during registration.
- `locales:` This array is a superset of locales for which the localized strings of this `serviceDescription` can be requested. The existence of a locale in this array does not imply that all fields of the `ServiceDescription` are available in the locale. Note that this is independent of the locales for which any of the portlets of this Producer might supply markup.

- `resourceList`: This is an array of `Resource` structures, each of which carries the values for a localized resource in various locales.
- `eventDescriptions`: This array of `EventDescription` structures describes the events the portlets hosted at the Producer could either generate or handle with matching to events at runtime via the event name. This information is provided to assist the Consumer in pre-determining the flow of events from one portlet to another. While this list is not required to be exhaustive (i.e. the portlet may generate an event it has not described), not describing an event greatly reduces its ability to be distributed by some Consumer's event distribution systems.
- `supportsExportByValue`: A optional boolean indicating whether or not the Producer supports exporting Portlets byValue. The default value for this field is "false".
- `recommendedExportSize`: A optional integer which indicates the normal limit the Producer places on the number of Portlets it is willing to export on a single invocation. When this field is missing, the Producer is providing no guidance to the Consumer concerning limiting the quantity of Portlets requested for export in any one invocation.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.21 Lifetime Type

The `Lifetime` structure contains fields related to when a particular artifact is scheduled for destruction. This introduces the ability of Producers and Consumers to cleanup such artifacts in scenarios such as the other party no longer being available.

```
Lifetime
   [R] dateTime currentTime
   [R] dateTime terminationTime
   [O] duration refreshDuration
   [O] Extension extensions[]
```

Members:

- `currentTime`: This field holds the date and time at which the structure was created. This allows for sensible use of the `terminationTime` field without requiring a protocol to synchronize clocks.
- `TerminationTime`: This field holds the date and time when the party sourcing the structure which contains this `Lifetime` information intends to destroy any underlying artifacts.
- `refreshDuration`: The appearance of this optional field tells the receiver that the originator of this information will adjust the `terminationTime` to a value of the supplied value plus the current time on each use of the underlying artifact.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.22 RegistrationState Type

The `RegistrationState` structure contains fields related to a particular registration of a Consumer with a Producer. It is returned by the **modifyRegistration** operation and contains the fields of a `RegistrationContext` that allow a Producer to push the storage of state at registration scope to the Consumer and indicate any change in the scheduled destruction of the registration.

```
RegistrationState
  [O] base64Binary    registrationState
  [O] Lifetime        scheduledDestruction
  [O] Extension       extensions[]
```

Members:

- `registrationState:` This field is used only when the Producer wants the Consumer to provide persistent storage for the state resulting from processing the registration. If the `RegistrationState` field has a value, the Consumer MUST return this value on any subsequent calls in the context of this registration [R362].
- `scheduledDestruction:` This optional field informs the Consumer that the Producer has changed the scheduled destruction of the underlying registration to the specified date and time. Producers returning this field MUST support the `RegistrationLifetime` portType. When this field is missing from a response message, scheduled destruction is not in use and the explicit destruction operations MUST be used instead.
- `extensions:` The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.23 RegistrationContext Type

The `RegistrationContext` structure contains fields related to a particular registration of a Consumer with a Producer. It is returned by the **register** operation and is a required parameter on most other operations.

```
RegistrationContext
  [R] Handle          registrationHandle
  [O] base64Binary    registrationState
  [O] Lifetime        scheduledDestruction
  [O] Extension       extensions[]
```

Members:

- `registrationHandle:` An unique, invariant and opaque reference to the Consumer-Producer relationship. This reference is generated by either the **register** operation [R355] or a process outside the scope of this specification. Note that Handles are restricted to a maximum length of 255 characters.
- `registrationState:` This field is used only when the Producer wants the Consumer to provide persistent storage for the state resulting from processing the registration. If the `RegistrationState` field has a value, the Consumer MUST return this value on any subsequent calls in the context of this registration [R362].
- `scheduledDestruction:` This optional field informs the Consumer that the Producer has scheduled the underlying registration to be destroyed on a certain date and time unless requested to change that date and time. Producers returning this field MUST support the `RegistrationLifetime` portType. When this field is missing from a response message, scheduled destruction is not in use and the explicit destruction operations MUST be used instead. Consumers do not need to send this field to the Producer on any operation that takes the `RegistrationContext` structure. Note that this is an output field only and will be ignored when sent to the Producer.

- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

5.1.24 desiredLocales

This parameter is used to control the locales for which localized strings are returned. The `desiredLocales` parameter is an array of strings, each of which specifies a single locale, whose order indicates the preference of the Consumer as to the locales for which values are returned. Since localized strings use an indirection through resources to carry the set of values for different locales, the first member of this array SHOULD be used as the locale for the values returned directly in the structure. When no `desiredLocales` array is supplied, the Consumer is requesting values for all returned localized strings in all locales where they are available. Since excessive amounts of data can impact both network transmission times and processing time at the Consumer, Producers are encouraged to only send the localized data the Consumer actually requests.

5.2 getServiceDescription Operation

This operation allows a Producer to provide information about its capabilities in a context-sensitive manner (e.g. registration may be required to discover the full capabilities of a Producer) [R303].

```
ServiceDescription = getServiceDescription(RegistrationContext,
                                           desiredLocales,
                                           portletHandles);
Faults: InvalidRegistration, ModifyRegistrationRequired,
        OperationFailed
```

Producers may choose to restrict the information returned in `serviceDescription` based on the supplied `RegistrationContext`. The minimum information a Producer MUST return from **getServiceDescription** is that which declares what is required for a Consumer to register (i.e. the `requiresRegistration` flag and whenever additional data is required, the `registrationPropertyDescription` field) with the Producer [R300][R301][R303]. Note that the `RegistrationContext` parameter is not likely to be supplied when an unregistered Consumer invokes **getServiceDescription**. This allows the Consumer to gain access to the information required to successfully register. It is recommended that Consumers invoke **getServiceDescription** after registering in order to receive a full description of the capabilities the Producer offers within the context of that registration. Producers MUST return a complete enough `ServiceDescription` to registered Consumers for them to properly interact with both the Producer and Portlets it exposes.

When generating the `ServiceDescription` response the Producer SHOULD use the `desiredLocales` (an array of strings) to control what locales are returned for localized strings.

While it is possible a `ServiceDescription` will change with time (e.g. Producer deploys additional Portlets), Producers are encouraged to return as complete a `ServiceDescription` as possible.

The optional `portletHandles` parameter provides a means for a Consumer to restrict the set of portlets for which it is requesting information. When the Consumer does not supply this parameter, the Producer MUST return a `portletDescription` for each of the “Producer Offered Portlets” the Consumer has access to through the supplied `registrationContext`.

6 Markup Interface

As interactive presentation-oriented web services, all WSRP compliant services implement the markup interface. This interface has operations to request the generation of markup and the processing of interactions with that markup [A300]. This section explains both the signatures for these operations and how the concepts of mode and window state impact the generation of the markup.

6.1 Data Structures

The normative definitions for all data structures are contained in the WSDL referenced in section 18. For the convenience of the reader, this non-normative section uses an IDL like syntax to describe these structures, where the leading [R] indicates a field is required and [O] indicates it is optional. The operations in this section introduce the following data structures:

6.1.1 SessionContext Type

The `SessionContext` structure contains the `ID` and `expires` information the Consumer needs to refer to the session in subsequent invocations.

```
SessionContext
  [R] ID        sessionID
  [R] int       expires
  [O] Extension extensions[]
```

Members:

- `sessionID:` An opaque string the Portlet defines for referencing state that is stored locally on the Producer. If the Consumer fails to return this reference on future invocations, the Portlet will be unable to reference this state and therefore likely not generate a markup fragment meeting the End-User's expectations. The maximum length of a `sessionID` is 4096 characters, though Producers SHOULD keep it as short as possible as this can have a significant impact on Consumer performance. Producers SHOULD also keep the `sessionID` as stable as possible since changes in value can also have a significant impact on Consumer performance.
- `expires:` Maximum number of seconds between invocations referencing the `sessionID` before the Producer will schedule releasing the related resources. A value of –1 indicates that the `sessionID` will never expire.
- `extensions:` The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

If the Producer returns an `InvalidSession` fault message after returning a `sessionID`, the Consumer MUST NOT resupply that sessionID on a subsequent invocation and SHOULD reinvoke the operation that caused the fault message without any `sessionID` and supply any data that may have been stored in the session.

6.1.2 RuntimeContext Type

The `RuntimeContext` structure defines a collection of fields used only in transient interactions between the Producer and Consumer.

```
RuntimeContext
  [R] string          userAuthentication
  [O] Key             portletInstanceKey
  [O] string          namespacePrefix
  [O] Templates       templates
  [O] ID              sessionID
  [O] Property        publicParameters[]
  [O] Extension       extensions[]
```

Members:

- `userAuthentication:` String indicating how the End-User was authenticated. Common values include:
  - "`wsrp:none`": No authentication was done, user information is asserted for informational purposes only.
  - "`wsrp:password`": The End-User identified themselves using the common userid/password scenario.
  - "`wsrp:certificate`": The End-User presented a security certificate to validate their identity.
  - Other strings: Some authentication was done outside this limited set of possibilities.
- `portletInstanceKey:` An opaque string, unique within the `RegistrationContext`, which the Consumer MAY supply as a reference to its use of the Portlet. The intent of this reference is to allow the Portlet, whenever needed, to namespace multiple instances of itself in an optimal manner. Examples include within any Producer-defined data sharing mechanisms and multiple inclusions on a Consumer page. Since this reference is a `Key`, its length is restricted to 255 characters. Consumer SHOULD keep their `portletInstanceKey` values as short as possible.
- `namespacePrefix:` This field provides a useful string for the Portlet prefixing of tokens that need to be unique on the aggregated page (e.g. JavaScript variables, html id attributes, etc.).
- `templates:` If this Portlet declared `doesUrlTemplateProcessing` as "true" in its `PortletDescription`, then this field contains the templates the Consumer is supplying for that processing. If the `PortletDescription` also has `templatesStoredInSession` set to "true", then the Consumer MAY elect to only send these once for a `sessionID`.
- `sessionID:` An opaque string the Producer defines for referencing state stored locally on the Producer. If the Producer has returned such a reference and the Consumer fails to return it in this field on future invocations, the Portlet will be unable to reference this state and therefore likely not generate a markup fragment meeting the End-User's expectations.
- `publicParameters:` These data values are aspects of Consumer-managed state that is supplied to the portlet on each invocation. The Portlet indicates the items it wishes to receive in its `portletDescription` and the Consumer supplies which ever of the requested items it chooses to, with values taken from whatever source it chooses. Example include a zipcode item taken from the user's profile, but later updated based on information extracted from an event a portlet has generated. Portlets do not store these items in any portion of their state as the Consumer supplies the items on each invocation.

- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.3 PortletContext Type

The `PortletContext` structure is used as a parameter on many operations to supply the Portlet information that was pushed to the Consumer.

```
PortletContext
  [R] Handle          portletHandle
  [O] base64Binary    portletState
  [O] Lifetime        scheduledDestruction
  [O] Extension       extensions[]
```

Members:

- `portletHandle`: An opaque and invariant handle, unique within the context of the Consumer's registration (unique within the Producer for Producers not supporting registration). Note that `Handles` are restricted to a maximum length of 255 characters.
- `portletState`: An opaque field the Portlet uses when it depends on the Consumer to store its persistent state [A205]. If the `portletState` field has a value, the Consumer MUST return this value on subsequent calls using the same `portletHandle`. Note that such uses can span multiple starting and stopping cycles of the Consumer and therefore this state MUST be persisted by the Consumer until successfully invoking **destroyPortlets** with the related `portletHandle`.
- `scheduledDestruction`: This optional field informs the Consumer that the Producer has scheduled the Portlet to be destroyed on a certain date and time unless requested to change that date and time. Producers returning this field MUST support the `PortletLifetime` portType. When this field is missing, scheduled destruction is not in use and the explicit destruction operations MUST be used instead. Consumers do not need to send this field to the Producer on any operation that takes the `PortletContext` structure. Note that this is an output field only and will be ignored when sent to the Producer.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.4 Standard UserScopes

This specification defines initial values for `UserScopes. UserScope` is an open set of values where the Producer SHOULD restrict the values supplied to those specified in this specification or custom values the Consumer has indicated it supports. If another value is specified and the Consumer does not understand it, the Consumer should ignore the cache control and treat the content as non-cacheable. The following values are defined by this specification:

- "`wsrp:perUser`": The markup is specific to the userContext for which it was generated. Changes to the data of the `UserContext` MUST invalidate the cached markup.
- "`wsrp:forAll`": The markup is not specific to the `UserContext` and therefore may be supplied to all users of the Consumer.

6.1.5 CacheControl Type

The `CacheControl` structure contains a set of fields needed for the Portlet to manage cached markup fragments. Note that any key used by the caching system to locate this markup MUST include the `MarkupParams` structure that was current when the content was originally cached.

```
CacheControl
  [R] int       expires
  [R] string    userScope
  [O] string    validateTag
  [O] Extension extensions[]
```

Members:

- `expires:` Number of seconds the markup fragment referenced by this cache control entry remains valid. A value of –1 indicates that the markup fragment will never expire.
- `userScope:` A string indicating when the markup may be used by various users. If the Consumer does not know how to process the specified `userScope`, it MUST NOT cache the markup.
- `validateTag:` A string the Consumer MAY use to attempt to revalidate markup once the `expires` duration elapses. This potentially eliminates the need for the Portlet to regenerate the markup and thereby can significantly improve the performance for the End-User.
- `extensions:` The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.6 Templates Type

The `Templates` structure contains a set of fields that enable Producer URL writing. The template style format of these fields is defined in section 14.2.2.

```
Templates
  [O] string    defaultTemplate
  [O] string    blockingActionTemplate
  [O] string    renderTemplate
  [O] string    resourceTemplate
  [O] string    secureDefaultTemplate
  [O] string    secureBlockingActionTemplate
  [O] string    secureRenderTemplate
  [O] string    secureResourceTemplate
  [O] Extension extensions[]
```

Members:

- `defaultTemplate:` This template provides the default value for all of the other template fields that do not begin with the string “secure”.
- `blockingActionTemplate:` This template provides the template for URLs that will be directed to the Consumer and processed as a **performBlockingInteraction** on the Portlet.
- `renderTemplate:` This template provides the template for URLs that will be directed to the Consumer and processed as a **getMarkup** on the Portlet.
- `resourceTemplate:` This template provides the template for URLs that will be directed to the Consumer and processed as an HTTP GET on the named resource.
- `secureDefaultTemplate:` This template provides the default value for all the secure template fields.

- `secureBlockingActionTemplate`: This template provides the template for secure URLs that will be directed to the Consumer and processed as a **performBlockingInteraction** on the Portlet using a secure protocol.
- `secureRenderTemplate`: This template provides the template for secure URLs that will be directed to the Consumer and processed as a **getMarkup** on the Portlet using a secure protocol.
- `secureResourceTemplate`: This template provides the template for secure URLs that will be directed to the Consumer and processed as an HTTP GET over SSL/TLS on the named resource.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from a namespaces other than WSRP.

6.1.7 CCPPProfileDiff Type

The `CCPPProfileDiff` structure holds the information defined by the CC/PP standard for declaring differences from the referenced profiles.

```
CCPPProfileDiff
  [R] string          diffName
  [R] string          description
  [O] Extension       extensions[]
```

Members:

- `diffName`: This field provides the header name consisting of the prefix “Profile-Diff-” and a number as defined in the CC/PP exchange.
- `description`: This field carries the XML/RDF describing the difference.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.8 CCPPHeaders Type

The `CCPPHeaders` structure holds the information defined by the CC/PP standard.

```
CCPPHeaders
  [R] string          profile
  [O] CCPPProfileDiff profileDiffs[]
  [O] Extension       extensions[]
```

Members:

- `profile`: This field carries the list of profiles as defined in the CC/PP standard.
- `profileDiffs`: This array carries the profile-diff headers from the CC/PP exchange.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.9 ClientData Type

The `MarkupParams` structure carries information concerning the user agent using this type.

```
ClientData
  [O] string          userAgent
  [O] CCPPHeaders     ccppHeaders
  [O] Extension       extensions[]
```

Members:

- `userAgent`: String identifying the user-agent of the End-User.
- `ccppHeaders`: Contain the WSRP representation of the CCPP Headers which were received by the Consumer.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.10 NamedString Type

The `NamedString` type provides a standardized way of carrying a simple name/value pair. Since this type is expected to be reused in extensions, it is defined in a separate namespace from the rest of the types defined by this specification.

```
NamedString
  [R] string    name
  [R] string    value
```

Members:

- `name`: The name to be associated with this value.
- `value`: The associated value.

6.1.11 MarkupParams Type

The `MarkupParams` structure contains a set of fields needed for the Portlet to generate markup that will enable the End-User to visualize the state of the Portlet. These are also supplied to the interaction processing operations as they may impact that processing (e.g. `validNewModes`) and those operations are allowed to return markup and thereby avoid an additional invocation.

```
MarkupParams
  [R] boolean         secureClientCommuncation
  [R] string          locales[]
  [R] string          mimeTypes[]
  [R] string          mode
  [R] string          windowState
  [O] ClientData      clientData
  [O] string          navigationalState
  [O] string          markupCharacterSets[]
  [O] string          validateTag
  [O] string          validNewModes[]
  [O] string          validNewWindowStates[]
  [O] Extension       extensions[]
```

Members:

- `clientData`: A structure (defined in section 6.1.7) that provides information about the client device which will render the markup.
- `secureClientCommunication`: A flag indicating whether or not the delivery channel between a client and Consumer is secure [R401]. The Consumer MUST set the `secureClientCommunication` flag as the Portlet MAY render different content when it knows the delivery channel is secure.

- `locales`: An array of locales where the order in the array is the Consumer's order of preference for the Portlet to generate the markup (e.g. "en-US"). Note that current practice on the Internet uses the format [2 char language code][9] "-" [2 char country code][10] as per the provided example. The Consumer can supply this information based on the setting the End-User has requested, but is encouraged to also take into account the locales the PortletDescription declared were supported for the mime types being requested.
- `mimeTypes`: An array of Mime types[11] (e.g. "text/html", "application/xhtml+xml", etc.) where the order in the array is the order in which the Consumer would prefer the Portlet generate the markup (i.e. first is most preferred, second is next preferred, etc.). In addition to these fully specified Mime types, use of "*" (indicates all Mime types are acceptable) and type/* (where type includes things such as "text") from the HTTP definition[12] MAY be specified. Portlets SHOULD generate markup in one of the specified Mime types. The Producer/Portlet does not have to process any optional parameters that can be included on mime type declarations.
- `mode`: The mode for which the Portlet should render its output. A set of modes is defined in this specification (see section 6.9). In addition, the Portlet's metadata indicates which of these modes the Portlet supports as well as any Producer-defined modes. The Consumer MUST specify either one of the modes from the Portlet's metadata or "`wsrp:view`" (all Portlets are required to support this mode).
- `windowState`: The state of this Portlet's virtual window relative to other Portlets on the aggregated page. Constants and definitions for the specification-defined states are found in section 6.10. The Consumer MUST specify either one of the windowStates from the Portlet's metadata or "`wsrp:normal`" (all Portlets are required to support this windowState).
- `navigationalState`: This field contains the opaque navigational state for this portlet. To exist, navigational state must be set explicitly on each URL activation or by setting its value upon return from **performBlockingInteraction**.
- `markupCharacterSets`: An array of `characterSets`[13] (e.g. "UTF-8", "ISO-10646-Unicode-Latin1", etc.) the Consumer is willing to have the Portlet use for encoding the markup (i.e. the character set for the aggregated page). The order of this array indicates the preferred ordering of the Consumer with the first element in the array being the most preferred. When the SOAP binding is in use, the Producer MUST either use one of the markupCharacterSets, UTF-8 or UTF-16 for the response message as the nature of XML requires the character set used for the markup to be the same as the response message.
- `validateTag`: This field MAY contain a `validateTag` previously supplied to the Consumer in a `MarkupContext` structure. When this field has a value, the Consumer is indicating it has markup cached for the Portlet, but the `CacheControl` structure governing the use of that cached markup no longer indicates it is valid. The Consumer is supplying the `validateTag` as a means for the Portlet to avoid generating new markup if the cached markup can be validated. The Portlet sets the `useCachedMarkup` field in the returned `MarkupContext` to "true" to indicate the markup referenced by the `validateTag` is still valid.
- `validNewModes`: Current set of modes the Producer MAY request changing to. These can be used to specify a mode change either via an `UpdateResponse` or within an URL

[9] http://lcweb.loc.gov/standards/iso639-2/langcodes.html
[10] http://www.din.de/gremien/nas/nabd/iso3166ma/codlstp1/en_listp1.html
[11] http://www.isi.edu/in-notes/iana/assignments/media-types/media-types
[12] http://www.ietf.org/rfc/rfc2616.txt
[13] http://www.iana.org/assignments/character-sets

written into the returned markup. It should be noted that this is no guarantee that a requested transition will be honored, as factors not easily represented may cause the Consumer to reject a requested transition. The primary reason for supplying this information is to assist the Portlet in preparing a user interface that does not contain links the Consumer will not honor. If no values are supplied, the Portlet can assume that all transitions are valid. Consumers can indicate they prohibit all transitions by supplying just the current `mode` in this array.

- `validNewWindowStates`: An array of `windowStates` which the Consumer is indicating as available to be requested as a `newWindowState` in `UpdateResponse`. It should be noted that this is no guarantee that a requested transition will be honored, as factors not easily represented may cause the Consumer to reject a requested transition. The primary reason for supplying this information is to assist the Portlet in preparing a user interface that does not contain links the Consumer will not honor. If no values are supplied, the Portlet can assume that all transitions are valid. Consumers can indicate they prohibit all transitions by supplying just the current `windowState` in this array.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

Custom `modes`, `windowStates`, `userScopes` and `userAuthentication` values MUST be URI's in order to reduce name clashes with any values that may be defined by future versions of this specification.

6.1.12 MarkupContext Type

The `MarkupContext` structure contains fields relative to returning markup from various invocations.

```
MarkupContext
  [O] boolean         useCachedMarkup
  [O] string          mimeType
  [O] string          markupString
  [O] base64Binary    markupBinary
  [O] string          locale
  [O] boolean         requiresUrlRewriting
  [O] CacheControl    cacheControl
  [O] string          preferredTitle
  [O] string          ccppProfileWarning
  [O] Extension       extensions[]
```

Members:

- `useCachedMarkup`: A boolean used to indicate whether the markup the Consumer indicated it has cached is still valid. The default value of this field is “false” (i.e. new markup is being returned for the Consumer’s use). If the value for `useCachedMarkup` is “true” the `markupString` and `markupBinary` fields MUST NOT be returned. If the field’s value is “true”, any supplied `cacheControl` field MUST be processed as a replacement for the `cacheControl` originally supplied with the cached markup.
- `mimeType`: The mime type of the returned markup. The `mimeType` field MUST be specified whenever markup is returned, and if the `markupBinary` field is used to return the markup, the mime type MUST include the character set for textual mime types using the syntax specified in RFC1522[14] (e.g. “text/html; charset=UTF-8”). In this particular case this character set MAY be different than the response message.
- `markupString`: The markup to be used for visualizing the current state of the Portlet. This is a string in order to support non-XML markup (e.g. HTML). If this is encoded in a SOAP message (i.e. XML), various characters will likely need to be escaped using

[14] http://www.ietf.org/rfc/rfc1522.txt

XML entities (e.g. "<" becomes "<"), either by the Portlet or the Producer's runtime. The character set of the markup a Portlet returns MUST either match that requested in `MarkupParams`, be UTF-8 or UTF-16. When a SOAP binding is used, the XML specification requires the character set of the markup match the character set of the response message's document. This field is only missing when the `useCachedMarkup` flag is "true". This field is mutually exclusive with returning the markup in the `markupBinary` field.

- `markupBinary`: The markup to be used for visualizing the current state of the Portlet returned in binary. This is useful if the text is not easily mapped to the string type or an attachment scheme is in use that moves binary types into separate message parts (e.g. DIME). This field is mutually exclusive with returning the markup in the `markupString` field.
- `locale`: The locale of the returned markup. The locale MUST be specified whenever markup is returned and is NOT REQUIRED to be from the set of requested locales.
- `requiresUrlRewriting`: A flag by which the Portlet/Producer indicates whether or not Consumer-side URL rewriting (see section 14.2.1) is required. The Consumer MUST parse the markup for URL rewriting if the value of `requiresUrlRewriting` is "true". The default value for this flag is "false".
- `cacheControl`: Defines the caching policies for the returned markup fragment. If the `cacheControl` field is not supplied, the Portlet is indicating it does not consider the markup cacheable. This is without prejudice to consumer specific caching policies.
- `preferredTitle`: The title the Portlet would prefer to be used in any decoration of the markup. The locale and markup type, for textual markup types only, of the preferred title has to be identical to that of the markup.
- `ccppProfileWarning`: This field can carry a list of warning values as defined in the CC/PP standard.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.13 MarkupResponse Type

The `MarkupResponse` structure contains fields for returning various items in response to a **getMarkup** invocation.

```
MarkupResponse
  [R] MarkupContext   markupContext
  [O] SessionContext  sessionContext
  [O] Extension       extensions[]
```

Members:

- `markupContext`: A structure carrying the returned markup and fields related to the markup.
- `sessionContext`: This structure contains session-oriented fields that may be returned from various operations, including a new `sessionID` and the duration before it `expires`.
- `extensions`: The `extensions` field MAY be used to extend this structure with elements from namespaces other than WSRP.

6.1.14 EventPayload Type

The `EventPayload` structure provides a wrapper for the data carried by an event.

```
EventPayload
  [R] Object    any
```

Members:

- `any`: The wrapper element for the event's data.

6.1.15 Event Type

The `Event` structure provides the references back to the QName and payload datatype provided by the `EventDescription`.

```
Event
  [R] QName            name
  [R] QName            type
  [O] boolean          requiresSecureDistribution
  [O] EventPayload     payload
  [O] Extension        extensions[]
```

Members:

- `name`: The namespaced name of the event.
- `type`: A reference to a schema-defined type for the event's payload.
- `requiresSecureDistribution`: This boolean (default value is derived from the cooresponding `EventDesciption`, '`false`' if there is no `EventDesciption` for the supplied `QName`) indicates whether or not the event requires a secure communication channel in order to be distributed. This is generally used if the event payload contains sensitive information that should not be exposed in an indiscriminate manner. This setting MUST be respected by the Consumer even when portions of the information are distributed in manners other than distributing a Portlet generated event.
- `payload`: This field contains the data for the event. Its contents MUST conform to the schema referenced by the eventType field.
- `extensions`: The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.16 UpdateResponse Type

The `UpdateResponse` structure contains the items normally returned by **performBlockingInteraction**.

```
UpdateResponse
   [O] SessionContext  sessionContext
   [O] PortletContext  portletContext
   [O] MarkupContext   markupContext
   [O] Event           events[]
   [R] string          navigationalState
   [O] string          newWindowState
   [O] string          newMode
```

Members:

- `sessionContext`: This structure contains session-oriented fields that may be returned from various operations, including a new `sessionID` and the duration before it `expires`.
- `portletContext`: This structure is where a Portlet using Consumer-side persistent storage may return a change in its persistent state, provided the `portletStateChange` flag in `InteractionParams` had been set to "`readWrite`" or "`cloneBeforeWrite`". When the `portletStateChange` flag had been set to "`cloneBeforeWrite`", this may also include a new `portletHandle`. The sequence by which a Portlet can otherwise request changing this state is described in section 6.4.2.1.
- `markupContext`: Markup may be returned at the end of interaction processing as an optimization that avoids an additional remote invocation. To ensure End-Users receive expected behavior from bookmarked pages, it is important that Portlets taking advantage of this optimization use the navigational state that the Consumer would have had for invoking **getMarkup**.
- `events`: An optional array of Event structures specifying the events generated during the processing of the operation returning this structure. These events MUST be in the order in which they were generated with the first generated event appearing first in the array.
- `navigationalState`: Opaque representation of navigational state which the Portlet is returning to the Consumer to indicate the navigational state to be supplied to **getMarkup** including for page refreshes and page bookmarks. This state is for the purpose of generating markup. The Consumer SHOULD supply this value as the `navigationalState` on the subsequent invocations for this use of the Portlet for at least the duration of the End-User's interactions with this aggregated page in order to maintain End-User state. The Consumer is not required to persist the `navigationalState` for longer than this set of interactions, but can provide such a persistence if desired.
- `newWindowState`: A request from the Portlet to change the window state. See section 6.9 relative to the processing of such requests.
- `newMode`: A request from the Portlet to change the mode. See section 6.8 relative to the processing of such requests.

For optimization purposes this structure allows markup to be returned even while state changes, events and mode/windowState change requests are also returned. The semantics of this are that the markup reflects the current portlet state and assumes any requested changes to the mode and/or windowState are honored by the Consumer.

6.1.17 BlockingInteractionResponse Type

The `BlockingInteractionResponse` structure contains the various items **performBlockingInteraction** can return.

```
BlockingInteractionResponse
  [O] UpdateResponse  updateResponse
  [O] string          redirectURL
  [O] Extension       extensions[]
```

Members:

- `updateResponse`: This field captures the items returned when the Portlet is not directing the user to a different URL. It is mutually exclusive with the `redirectURL` field.
- redirectURL: As a result of processing this interaction, the Portlet may indicate to the Consumer that it would like the End-User to view a different URL. It is mutually exclusive with the `updateResponse` field.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.18 HandleEventsFailed Type

The `HandleEventsFailed` structure contains the index of event in the incoming events array that could not be processed fully by the Producer, and the reason for failure.

```
HandleEventsFailed
  [R] int             index
  [R] string          faultCode
  [O] string          faultString
  [O] any             detail
  [O] Extension       extensions[]
```

Members:

- `index`: The 0-based index of the event where processing failed for the stated reason.
- `faultCode`: A fault code from section 17 describing the reason the handling of the event failed.
- `faultString`: An optional, human readable string describing the failure.
- `detail`: An open content element for transferring details concerning the failure.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.19 HandleEventsResponse Type

The `HandleEventsResponse` structure contains the various items **handleEvents** can return. Note that this structure ~~is identical to~~extends the `BlockingInteractionResponse` structure to add a field for returning indications of failures to process some of the supplied events. The normative WSDL re~~alization of~~cognizes this ~~structure recognizes this by declaring both elements to be of the same~~relationship in its type definitions.

```
HandleEventsResponse
  [O] UpdateResponse          updateResponse
  [O] string                  redirectURL
  [O] HandleEventsFailed      failedEvents[]
  [O] Extension               extensions[]
```

Members:

- `updateResponse`: This field captures the items returned when the Portlet is not directing the user to a different URL. It is mutually exclusive with the `redirectURL` field.

- `redirectURL`: As a result of processing this interaction, the Portlet may indicate to the Consumer that it would like the End-User to view a different URL. It is mutually exclusive with the `updateResponse` field.
- `failedEvents`: This optional array carries notifications to the Consumer of events the Portlet failed to process. Since the Producer/Portlet is capable of appropriate retries for the processing of any given event, the Consumer MUST NOT retry distributing the failed event to the Portlet.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.20 StateChange Type

This type is a restriction on the string type that is constrained to the values "`readWrite`", "`cloneBeforeWrite`" or "`readOnly`", the meanings of which are explained in section 6.4.3.

6.1.21 UploadContext Type

The `UploadContext` structure contains fields specific to uploading data to the Portlet.

```
UploadContext
  [R] string          mimeType
  [R] base64Binary    uploadData
  [O] NamedString     mimeAttributes[]
  [O] Extension       extensions[]
```

Members:

- `uploadData`: A binary data blob that is being uploaded.
- `mimeType`: Mime type of what is in the `uploadData` field. The syntax for this value is defined in RFC1522[15] (e.g. "text/html; charset=UTF-8").
- `mimeAttributes`: Mime attributes that are not represented elsewhere.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.22 InteractionParams Type

The `InteractionParams` structure contains fields specific to invoking the **performBlockingInteraction** operation.

```
InteractionParams
  [R] StateChange     portletStateChange
  [O] string          interactionState
  [O] NamedString     formParameters[]
  [O] UploadContext   uploadContexts[]
  [O] Extension       extensions[]
```

Members:

- `portletStateChange`: A flag by which a Consumer indicates whether or not the processing of the interaction is allowed to return a modified `portletState`. This flag is needed; as only the Consumer knows whether or not such a state change would be acceptable. In many cases where the Consumer does not authorize the End-User to modify the persistent state of the Portlet in use, it may permit the Producer to clone the Portlet (i.e. set `portletStateChange` to "`cloneBeforeWrite`") and return a clone of the

[15] http://www.ietf.org/rfc/rfc1522.txt

Portlet in addition to any other return parameters. The full use of this flag is described in section 6.4.2.1.

- `interactionState`: Opaque representation of transient information for use in processing this invocation of **performBlockingInteraction**. The value for this field is supplied through the portlet URL parameter `wsrp-interactionState` (see section 14.2.1.3).
- `formParameters`: Name/value pairs reflected, for example, in the case of HTML either from the query string of forms submitted with method=get or in a request with mime type = "application/x-www-form-urlencoded" for method=post. For the case of query string parameters, Consumers should take care with regard to how user-agents encode this data. In particular, common user-agents (i.e. web browsers) encode posted data in the character set of the response that generated the page the form is on. As the Producer is ignorant of this encoding and the Consumer is required to consistently encode parameters passed to the Producer in the SOAP message, Consumers MUST ensure that form data is properly decoded before it is passed to the Producer.
- `uploadContexts`: An optional field where mime types not parsed into `formParameters` are placed for transfer to the Producer.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.23 EventParams Type

The `EventParams` structure contains fields specific to invoking the **handleEvents** operation.

```
EventParams
  [R] StateChange     portletStateChange
  [O] Extension       extensions[]
```

Members:

- `portletStateChange`: A flag by which a Consumer indicates whether or not the processing of the event is allowed to return a modified `portletState`. This flag is needed; as only the Consumer knows whether or not such a state change would be acceptable. In many cases where the Consumer does not authorize the End-User to modify the persistent state of the Portlet in use, it may permit the Producer to clone the Portlet (i.e. set `portletStateChange` to "`cloneBeforeWrite`") and return a clone of the Portlet in addition to any other return parameters. The full use of this flag is described in section 6.4.2.1.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.24 ResourceParams Type

The `ResourceParams` structure contains fields specific to invoking the **getResource** operation.

```
ResourceParams
  [R] ID              resourceID
  [O] NamedString     formParameters[]
  [O] UploadContext   uploadContexts[]
  [O] Extension       extensions[]
```

Members:

- `resourceID`: This field provides the identifier the Portlet had placed on the URL requesting the resource.
- `formParameters`: Name/value pairs reflected, for example, in the case of HTML either from the query string of forms submitted with method=get or in a request with mime

type = “application/x-www-form-urlencoded” for method=post. For the case of query string parameters, Consumers should take care with regard to how user-agents encode this data. In particular, common user-agents (i.e. web browsers) encode posted data in the character set of the response that generated the page the form is on. As the Producer is ignorant of this encoding and the Consumer is required to consistently encode parameters passed to the Producer in the SOAP message, Consumers MUST ensure that form data is properly decoded before it is passed to the Producer.

- `uploadContexts`: An optional field where mime types not parsed into `formParameters` are placed for transfer to the Producer.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.25 User Profile Types

The `UserProfile` structure is used to carry information about the End-User. The Portlet uses the `userProfileItems` in its metadata to describe the fields it uses to generate markup from this set and any others the Consumer indicated were available when it registered. See Section 15 for a complete description of this portion of the protocol. We expect that most extensions of the types referenced by `UserProfile` will be of the type `NamedString` and encourage its reuse in this manner.

```
UserProfile
  [O] PersonName      name
  [O] dateTime        bdate
  [O] string          gender
  [O] EmployerInfo    employerInfo
  [O] Contact         homeInfo
  [O] Contact         businessInfo
  [O] Extension       extensions[]
```

Members:

- `name`: A structure containing the various fields for the End-User’s name.
- `bdate`: The End-User’s birthdate. This uses the schema-defined datatype for DateTime rather than Date as not all web stacks serialize / deserialize Date properly.
- `gender`: The End-User’s gender (“M” = male, “F” = female).
- `employerInfo`: A structure containing various fields for the End-User employer’s information.
- `homeInfo`: The End-User’s home location information.
- `businessInfo`: The End-User’s work location information.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.25.1 PersonName Type

The `PersonName` structure carries the detailed fields for the parts of an End-User's name.

```
PersonName
  [O] string    prefix
  [O] string    given
  [O] string    family
  [O] string    middle
  [O] string    suffix
  [O] string    nickname
  [O] Extension extensions[]
```

Members:

- `prefix`: Examples include Mr, Mrs, Ms, Dr, etc.
- `given`: The End-User's first or given name.
- `family`: The End-User's last or family name.
- `middle`: The End-User's middle name(s) or initial(s).
- `suffix`: Examples include Sr, Jr, III, etc.
- `nickname`: The End-User's preferred nick name.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.25.2 EmployerInfo Type

The `EmployerInfo` structure contains the detailed fields concerning the End-User's employer.

```
Employerinfo
  [O] string    employer
  [O] string    department
  [O] string    jobtitle
  [O] Extension extensions[]
```

Members:

- `employer`: The name of the employer.
- `department`: The name of the department the End-User works within.
- `jobTitle`: The title of the End-User's job.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.25.3 TelephoneNum Type

The `TelephoneNum` structure is used to describe the subfields of a phone number.

```
TelephoneNum
  [O] string    intcode
  [O] string    loccode
  [O] string    number
  [O] string    ext
  [O] string    comment
  [O] Extension extensions[]
```

Members:

- `intcode`: The international telephone code.
- `loccode`: Local telephone area code.

- `number`: The telephone number.
- `ext`: Any telephone number extension.
- `comment`: Comment about this phone number.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.25.4 Telecom Type

The `Telecom` structure is used to describe the various phone contact information.

```
Telecom
  [O] TelephoneNum    telephone
  [O] TelephoneNum    fax
  [O] TelephoneNum    mobile
  [O] TelephoneNum    pager
  [O] Extension       extensions[]
```

Members:

- `telephone`: Standard phone number.
- `fax`: Phone number for faxes.
- `mobile`: Phone number for mobile contact.
- `pager`: Phone number for activating a pager.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.25.5 Online Type

The `Online` structure is used to describe the various phone contact information.

```
Online
  [O] string    email
  [O] string    uri
  [O] Extension extensions[]
```

Members:

- `email`: Email address.
- `uri`: Relevant web page.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.25.6 Postal Type

The `Postal` structure carries the detailed fields describing a particular address.

```
Postal
  [O] string    name
  [O] string    street
  [O] string    city
  [O] string    stateprov
  [O] string    postalcode
  [O] string    country
  [O] string    organization
  [O] Extension extensions[]
```

Members:

- `name`: The name to which items should be addressed.

- `street`: The street portion of the address.
- `city`: The city portion of the address.
- `stateprov`: The state or province portion of the address.
- `postalcode`: The postal code portion of the address.
- `country`: The country portion of the address.
- `organization`: Any organization needing to be specified in the address.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.25.7 Contact Type

The `Contact` structure is used to describe a location for the End-User.

```
Contact
  [O] Postal     postal
  [O] Telecom    telecom
  [O] Online     online
  [O] Extension  extensions[]
```

Members:

- `postal`: Postal oriented contact information.
- `telecom`: Telephone oriented contact information..
- `online`: Web oriented contact information.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.1.26 UserContext Type

The `UserContext` structure supplies End-User specific data to operations. Note that this does not carry user credentials (e.g. userID / password) as quite flexible mechanisms for communicating this information are being defined elsewhere (e.g. WS-Security (see section 3.1.2) defines how to carry User Information in a SOAP header).

```
UserContext
  [R] Key             userContextKey
  [O] string          userCategories[]
  [O] UserProfile     profile
  [O] Extension       extensions[]
```

Members:

- `userContextKey`: This key is a token that the Consumer supplies to uniquely identify the UserContext. The `userContextKey` MUST remain invariant for the duration of a Consumer's registration. The Producer can use this key as a reference to the user.
- `userCategories`: An array of strings, each of which specifies an Producer-defined user category in which the Consumer places the End-User relative to the current operation. The Consumer MUST NOT assert a user category for which no `ItemDescription` was part of the Producer's `ServiceDescription`. See the discussion of user categories in section 6.11.
- `profile`: End-User profile data structure as defined in section 6.1.23~~6.1.20~~. Note that while the `UserContext` structure is passed to many operations, only the interaction oriented operations need this optional field to be supplied.
- `extensions`: The `extensions` field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

6.2 getMarkup Operation

The Consumer requests the markup for rendering the current state of a Portlet by invoking:

```
MarkupResponse = getMarkup(RegistrationContext, PortletContext,
                           RuntimeContext, UserContext, MarkupParams);
Faults: AccessDenied, InconsistentParameters, InvalidRegistration,
        ModifyRegistrationRequired, MissingParameters,
        OperationFailed, InvalidUserCategory, InvalidHandle,
        InvalidCookie, InvalidSession, UnsupportedMode,
        UnsupportedWindowState, UnsupportedLocale, UnsupportedMimeType
```

6.2.1 Caching of markup fragments

For performance reasons the Consumer might prefer to cache markup across a series of requests. The Producer passes information about the cacheability of the markup fragment in the `cacheControl` structure returned in a `MarkupContext` structure. The Consumer can infer from this information when it may cache markup and when the cached markup needs to be invalidated and updated by a new call to **getMarkup**.

6.2.1.1 Cacheability

Whenever the `cacheControl` field of a `MarkupResponse` structure is filled in the Consumer MAY cache the markup fragment. The Consumer MUST follow the defined invalidation policies from section 6.2.1.2 in order to keep the cache up-to-date. If the `cacheControl` field is empty, the Portlet has provided no guidance and the Consumer MAY apply whatever cache policy it chooses.

6.2.1.2 Cache Invalidation

The `expires` field of the `cacheControl` structure provides a time duration during which it is valid to supply the markup from a cache. Once this time has elapsed, counting from the point in time when the `MarkupContext` structure was returned, the Consumer can use the `validateTag` field of the `MarkupParams` structure to inquire whether the markup is still valid, as this potentially avoids having the Portlet regenerate the same markup. Portlets indicating the cached markup can be used SHOULD also supply a new `CacheControl` structure with a new expiry for the markup.

Consumers should be aware that invoking **performBlockingInteraction** may cause cached markup to become invalid. This version of the specification does not address how a Portlet can indicate that cached markup is invalid, but it is anticipated that future versions will address this issue.

6.3 getResource Operation

The Consumer requests a resource by invoking:

```
MarkupResponse = getResource(RegistrationContext, PortletContext,
                             RuntimeContext, UserContext,
                             ResourceParams, MarkupParams);
Faults: AccessDenied, InconsistentParameters, InvalidRegistration,
        ModifyRegistrationRequired, MissingParameters,
        OperationFailed, InvalidUserCategory, InvalidHandle,
        InvalidCookie, InvalidSession, UnsupportedMode,
        UnsupportedWindowState, UnsupportedLocale, UnsupportedMimeType
```

This operation is used whenever a URL has specified a value of `true` for the `wsrp-preferOperation` flag. It provides all the contextual information needed for a portlet to re-establish its state relevant to the End-User so that any generated mime type is able to take that state into account. This operation reuses the `MarkupResponse` structure as potentially any

mimetype could be returned. Consumers SHOULD supply a value of "*" in the `mimeTypes` field of the `MarkupParams` structure as the returned object should simply be streamed to the End-User.

6.3.1 Caching of resources

For performance reasons the Consumer might prefer to cache resources across a series of requests. The Producer passes information about the cacheability of the markup fragment in the `cacheControl` structure returned in a `MarkupContext` structure. The Consumer can infer from this information when it may cache the resource and when the cached resource needs to be invalidated and updated by a new call to **getResource**. All of the cache semantics described in section 6.2.1 applies to the caching of resources as well.

6.4 Interaction Operations

End-User interactions with the generated markup may result in invocations for the Portlet to respond to the interactions [A400]. In the case where the invocations may change the `navigationalState` or some data the Portlet is storing in a shared data area (including a database), an operation is needed to carry the semantics of this type of update. The Consumer MUST always propagate these End-User interactions to the Producer.

6.4.1 performBlockingInteraction Operation

This operation requires that both the Consumer beginning the generation of the aggregated page (because the invocation can return a `redirectURL`), invoking other operations on Portlets and the gathering of markup from other Portlets on the page (often because shared state, including state shared via a database, impacts the markup of other Portlets) are blocked until **performBlockingInteraction** either returns or communication errors occur. The Portlet will receive only one invocation of **performBlockingInteraction** per client interaction, excepting for retries.

```
BlockingInteractionResponse = performBlockingInteraction(
                                  RegistrationContext,
                                  PortletContext, RuntimeContext,
                                  UserContext, MarkupParams,
                                  InteractionParams);
Faults: AccessDenied, InconsistentParameters, InvalidRegistration,
        ModifyRegistrationRequired, MissingParameters,
        OperationFailed, InvalidUserCategory, InvalidHandle,
        InvalidCookie, InvalidSession, UnsupportedMode,
        UnsupportedWindowState, UnsupportedLocale, UnsupportedMimeType
        PortletStateChangeRequired
```

The Consumer has to wait for the response from **performBlockingInteraction** before invoking **getMarkup** on the Portlets it is aggregating. This permits any Producer-mediated sharing to proceed safely (provided it happens in a synchronous manner). Since this operation potentially returns state to the Consumer for storage, this operation also allows Consumers who wish to store this by propagating it to their client to do so before opening the stream for the aggregated page. Consumers doing this also enable End-User bookmarking of the aggregated page for later use. In order to support such bookmarking and reduce issues related to potentially reinvoking a transaction for the End-User, Consumers are encouraged to redirect the client in a manner that keeps a bookmarked page from reissuing a request to invoke **performBlockingInteraction**. Producer still need to be prepared for such repeated invocations as the End-User may activate the link that caused the invocation more than once.

Note, if the Producer chooses to use the optimized form of this operation and return markup directly, care must be taken to ensure the markup is generated with the `navigationalState` that will be returned from the operation and not the `navigationalState` that was passed to it. Also, the markup should presume that any requested `mode` or `windowState` changes are honored. This

ensures consistency when the optimization is not used and the Consumer invokes **getMarkup** after **performBlockingInteraction** returns.

6.4.2 handleEvents Operation

A useful way of describing the distinction between an interaction and an event is that an interaction is an encodable event (i.e. can be referenced by presentation markup) with an opaque payload which the Consumer will always attempt to deliver to the Portlet that generated the markup. This difference results in the need for a different signature that the Consumer uses to distribute events to a Portlet; namely:

```
HandleEventsResponse = handleEvents(RegistrationContext,
                                    PortletContext, RuntimeContext,
                                    UserContext, MarkupParams,
                                    EventParams, Event[]);
Faults:  AccessDenied, InconsistentParameters, InvalidRegistration,
         ModifyRegistrationRequired, InvalidUserCategory,
         InvalidHandle, InvalidCookie, InvalidSession,
         MissingParameters, OperationFailed,
         PortletStateChangeRequired, UnsupportedMode,
         UnsupportedWindowState, UnsupportedLocale, UnsupportedMimeType
```

These events provide a means by which a Portlet can become informed about changes in the environment where the Consumer is incorporating the Portlet's markup. These notifications could have originated from another Portlet or directly from the Consumer. It is the Consumer which determines which events to distribute to which Portlets, usually based on the needs of the environment (e.g. the portal application) and the metadata concerning the events Portlets can publish and/or handle. As the event distribution model is the Consumer managing distribution of independent notifications, Portlets should neither assume nor require a particular manner of event distribution in order to function properly.

6.4.2.1 Event handling

In order for the inherent overhead of remote invocations to not degrade End-User performance to unacceptable levels, WSRP collapses invocations that are equivalent outside of the event being processed into a single invocation that deals with an array of events.

Since events are independent notifications, both the Consumer and Producer/Portlet are encouraged to deal with events in a simple time-ordered manner. There is no semantic meaning to the order of the events.

~~Since the order of events might be important to the Consumer, the Producer/Portlet MUST return any generated events in a sequenced array (first generated event appears first in the array, etc).~~

While the Consumer MAY invoke **handleEvents** multiple times for any one Portlet while preparing to gather markup, it MUST NOT invoke **handleEvents** an additional time while the portlet is already processing ~~an~~ events for the same End-User.

6.4.2.2 State handling

The processing of an event can potentially impact any portion of a Portlet's state (namely; portletState, session state and navigationalState). Relevant to the persistent portletState, we would particularly note that cloning may occur and that the handling of the `portletStateChange` flag, which provides the Consumer control over cloning, is detailed in **[6.4.3]**.

6.4.2.3 Mode and WindowState handling

Events can return requests to the Consumer to change the mode or windowState of the portlet. The Consumer SHOULD respect a **handleEvents** invocation returning requests to change mode

or windowState provided they do not conflict with other such requests. How to handle any conflicting requests is up to the Consumer implementation.

6.4.3 Updating Persistent Portlet State

In designing how a Portlet and Consumer interact in order to update the persistent state of the Portlet, the following items were considered:

1. Only the Portlet knows when such a state change is desired. While it is expected that changes to persistent state will be relatively rare, they could occur on any interaction the Portlet has with an End-User.
2. Only the Consumer knows whether or not a persistent state change would be safe. Reasons for this include whether the persistent state is shared among a group of users, the authorization level of the End-User to impact any shared persistent state and Consumer policies regarding whether the persistent state is modifiable.

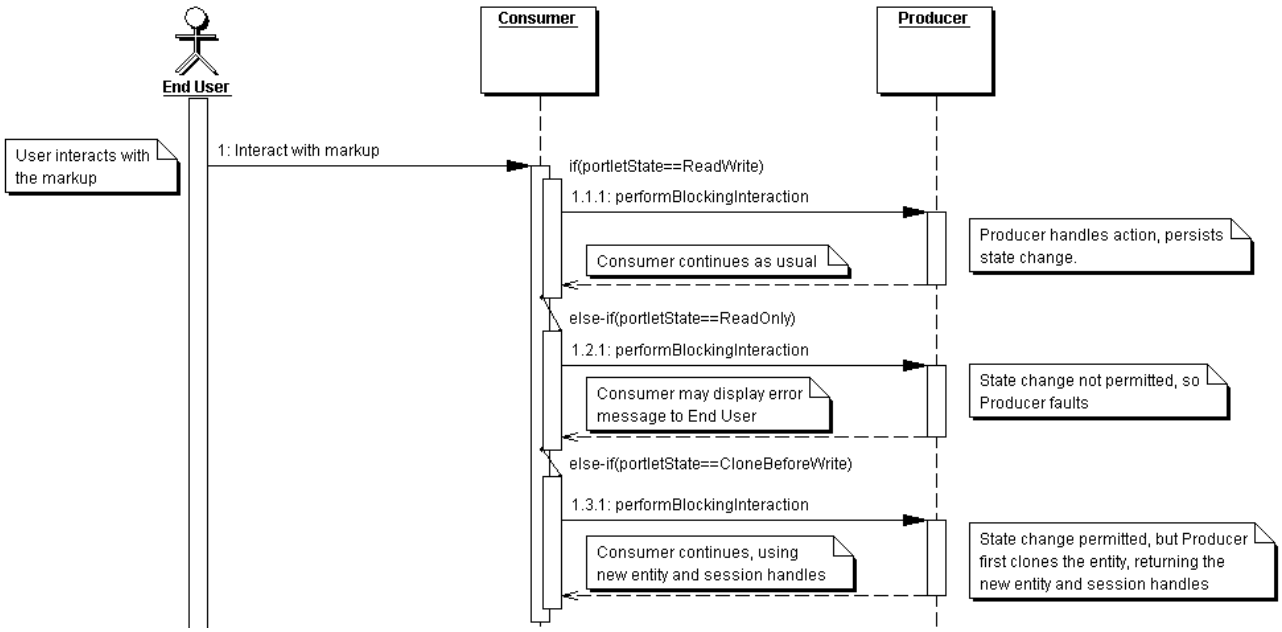
This combination requires that all persistent Portlet state changes happen in a manner that has Consumer approval for the change to occur, while the Portlet decides both when the change is required and its exact character. The Consumer indicates whether or not it is safe for the Portlet to modify its persistent state by setting the `portletStateChange` field in the `InteractionParams` structure. If the Consumer has set the `portletStateChange` flag to "`readWrite`", the Portlet MAY modify its persistent state regardless of whether it is persisted on the Producer or Consumer.

If the Consumer has set the `portletStateChange` field to "`cloneBeforeWrite`", persistent state changes are allowed only if the Producer first clones the Portlet. If the Producer does not clone the Portlet, processing attempts to modify persistent state MUST proceed as if the Consumer had specified "`readOnly`" for `portletStateChange`. If the Producer clones the Portlet, processing attempts to modify persistent state on the new Portlet SHOULD proceed as if the Consumer had specified "`readWrite`" for `portletStateChange`. The Producer returns the impact of any cloning to the Consumer, regardless of whether the `portletState` is persisted on the Producer or Consumer. If the Producer returns a new `portletHandle` without returning a new `sessionID`, the Consumer MUST associate the current `sessionID` with the new `portletHandle` rather than the previous `portletHandle`. The metadata associated with the original Portlet applies to any cloned Portlet as well.

If the Consumer has set the `portletStateChange` flag to "`readOnly`", the Portlet MUST NOT modify its persistent state regardless of whether it is persisted on the Producer or Consumer and MUST throw a fault message if processing the interaction requires changing its persistent state. Commonly Consumer's will only set the `portletStateChange` flag to "`readOnly`" for End-Users that are not authorized to clone or customize the Portlet (e.g. an End-User using a guest account).

If the Producer implements access control that prevents Portlets from updating persistent state and a Portlet is unable to process the interaction without such an update, then the fault "`PortletStateChangeRequired`" MAY be thrown indicating the interaction processing failed.

This set of possibilities is depicted in the following figure:



6.5 initCookie Operation

In general, the Producer completely manages its own environment, including items such as the initialization of cookies when using the HTTP transport. There are cases, however, when assistance from the Consumer in initializing these cookies is useful. Cookies needed to manage distribution of requests within a load balanced environment are an example of such. This operation is how the Consumer provides such assistance:

```
ReturnAny = initCookie(RegistrationContext);
Faults: AccessDenied, InvalidRegistration, ModifyRegistrationRequired,
        OperationFailed
```

If the Producer's metadata has set the `requiresInitCookie` field to any value other than "`none`", then the Consumer MUST invoke **initCookie** and supply any returned cookies according to the semantics of the value of `requiresInitCookie` as defined in section 5.1.19. If at any time the Producer throws a fault message ("`InvalidCookie`") indicating the supplied cookies have been invalidated at the Producer, then the Consumer MUST again invoke **initCookie** and SHOULD reprocess the invocation that caused the fault message to be thrown and include any data that may have been stored in a session related to a cookie.

6.6 releaseSessions Operation

The Consumer MAY inform the Producer that it will no longer be using a set of sessions by invoking **releaseSessions** (e.g. the Consumer is releasing resources related to the `sessionIDs`):

```
ReturnAny = releaseSessions(RegistrationContext, sessionIDs);
Faults: AccessDenied, InvalidRegistration, ModifyRegistrationRequired,
        MissingParameters, OperationFailed
```

After invoking **releaseSessions** the Consumer MUST NOT include any of the supplied `sessionIDs` on subsequent invocations.

6.7 Consumer Transitions across Bindings

Consumers need to be careful about the support supplied by the web stack with regards to multiple bindings that will be offered by many Producers. If a Producer indicates that it uses cookies, the Consumer MUST ensure that any cookies the Producer sets are available on all

invocations within the `Markup` interface. Another implication of the Producer indicating it uses cookies is that the Consumer should be aware of the issues involved in protocol transitions (e.g. from HTTP to HTTPS). Current technologies do not always manage cookies in a manner that allows cookies to be shared across such a transition. In addition, moving cookies from an HTTPS to an HTTP connection opens security issues that MUST be handled in the manner prescribed in RFC2109[16]. Consumers MUST respect the security setting on each cookie.

6.8 Stateful Portlet Scenarios

There are several common scenarios for Portlets with varying needs regarding statefulness [A202][A203]. This section explains how they map into the operational signatures above.

[16] http://www.ietf.org/rfc/rfc2109.txt

6.8.1 No State

This type of Portlet maintains no state, but encodes everything required to generate the markup on the URL causing the invocation of **getMarkup** [A201]. Often these Portlets involve only a single page, but could provide links on that page that cause the generation of a completely different markup due to the parameters passed when the link is activated.

Note: Invocations of **performBlockingInteraction** can happen in this scenario if the Portlet impacts some backend system as a result of the invocation as this impact could change the markup some other Portlet will generate.

The following table outlines the values for certain key parameters that support this scenario.

Method	Parameter/Field	Value	Comments
performBlockingInteraction	SessionContext / sessionID	Producer provided sessionContext / sessionID	No value as this Portlet uses no Producer-side state.
	InteractionParams / interactionState	Consumer extracts value from link.	Interaction state encoded on the URLs in the markup only.
	MarkupParams / navigationalState	Consumer extracts value from link.	Navigational state encoded on the URLs in the markup only.
	InteractionResponse / navigationalState	This type of Portlet does not return navigationalState.	
getMarkup	SessionContext / sessionID	Producer provided sessionContext / sessionID	No value as this Portlet uses no Producer-side state.
	MarkupParams / navigationalState	Consumer extracts value from link.	Navigational state from the URL.

6.8.2 Navigational State Only

This type of Portlet does not maintain state at the Producer, but does push navigational state out to the Consumer. Both to support these Portlets and to assist Consumers in properly supporting End-User page refreshes and bookmarks, Portlets are allowed to return their navigational state (i.e. the `navigationalState` field) back to the Consumer. It is then the responsibility of the Consumer to retransmit the `navigationalState` to the Producer with each request [A206].

A stateless Consumer can store the `navigationalState` for all of its aggregated Portlets by returning them to the client, for example by encoding them in the URL. Since this implementation

option requires the URL to be generated before the output stream is opened, the `navigationalState` of all Portlets must be known before the Consumer begins generating the output stream. In order to allow the Consumer to open the output stream before it has collected markup from all Portlets aggregated on the page, a **getMarkup** invocation is not allowed to modify the `navigationalState`. Only invocations of **performBlockingInteraction** are allowed to modify the `navigationalState` of a Portlet.

The following table outlines the values for certain key parameters that support this scenario.

Method	Parameter/Field	Value	Comments
performBlockingInteraction	SessionContext / sessionID	Producer provided sessionContext / sessionID	No value as this Portlet uses no Producer-side state.
	InteractionParams / interactionState	Consumer extracts value from link.	Interaction state encoded on the URLs in the markup only.
	MarkupParams / navigationalState	Consumer extracts value from link or previous value.	
	InteractionResponse / navigationalState	Portlet may compute a changed navigationalState.	
getMarkup	SessionContext / sessionID	Producer provided sessionContext / sessionID	No value as this Portlet uses no Producer-side state.
	MarkupParams / navigationalState	From link or from performBlockingInteraction.	

6.8.3 Local state

Portlets storing state locally on the Producer establish a session and return an opaque reference (i.e. a `sessionID`) which the Consumer then returns on all subsequent invocations of this Portlet instance on the aggregated page for this End-User in order to reconnect the Portlet to the state stored in the session. These Portlets can also push navigational state to the Consumer such that an End-User may bookmark some portion of the state for use in later conversations. The means by which the Consumer enables this functionality for the End-User is a Consumer implementation choice [A304].

The following table outlines the values for certain key parameters that support this scenario.

Method	Parameter/Field	Value	Comments
performBlockingInteraction	SessionContext / sessionID	Producer provided sessionContext / sessionID	With Producer side state, the session handle offers ability to store information without impacts message size to Consumer.
	InteractionParams / interactionState	Consumer extracts value from link.	Interaction state encoded on the URLs in the markup only.
	MarkupParams / navigationalState	Consumer extracts value from link or previous value.	
	InteractionResponse / navigationalState	Portlet may compute a changed navigationalState.	
getMarkup	SessionContext / sessionID	Producer provided sessionContext / sessionID	With Producer side state, the session handle offers ability to store information without impacts message size to Consumer.
	MarkupParams / navigationalState	From link or from performBlockingInteraction.	

6.9 Modes

A Portlet should render different content and perform different activities depending on its current state, the operation (with parameters) currently being processed, and the functionality requested by the End-User. A base set of functions is defined which reflects those common for portal-portlet interactions. They are referred to as modes and should be thought of as how the Consumer is managing the interaction with the End-User. Portlets may request mode changes either through parameters on a link that an End-User activates or by returning a `newMode` in a `BlockingInteractionResponse`. The Consumer MUST respect requests to change the mode outside of exceptional circumstances (e.g. access control restrictions), but the Portlet must not depend on such a request being respected.

During **getMarkup**and **performBlockingInteraction** invocations the Consumer indicates to the Portlet its current mode via the `MarkupParams` data structure.

Because modes are an extensible set of values, the following semantics apply relative to determining what modes are valid for the interactions of a Consumer with a Portlet:

1. Portlets specify what modes are supported through their `PortletDescription`. The Producer determines whether or not this information is available to the Consumer prior to registration.
2. During registration the Consumer informs the Producer about modes it uses on aggregated pages.
3. After registration, the `PortletDescription` can dynamically modify the set of modes supported to incorporate those specified by the Consumer during registration.
4. The Consumer is required to use one of the modes specified by the `PortletDescription` (or the required "`wsrp:view`" mode).

6.9.1 "wsrp:view" Mode

The expected functionality for a Portlet in `wsrp:view` mode is to render markup reflecting the current state of the Portlet. The `wsrp:view` mode of a Portlet will include one or more screens that the End-User can navigate and interact with or it may consist of static content devoid of user interactions.

The behavior and the generated content of a Portlet in the `wsrp:view` mode may depend on configuration, personalization and all forms of state.

Conformant Portlets MUST support the `wsrp:view` mode.

6.9.2 "wsrp:edit" Mode

Within the `wsrp:edit` mode, a Portlet should provide content and logic that let a user customize the behavior of the Portlet. The `wsrp:edit` mode can include one or more screens which users can navigate to enter their customization data.

Typically, Portlets in `wsrp:edit` mode will set or update Portlet state by making these changes persistent for the Portlet. How such changes impact Consumer management of Portlet usage by End-Users is discussed in section 6.4.2.1.

6.9.3 "wsrp:help" Mode

When in `wsrp:help` mode, a Portlet may provide help screens that explains the Portlet and its expected usage. Some Portlets will provide context-sensitive help based on the markup the End-User was viewing when entering this mode.

6.9.4 "wsrp:preview" Mode

In `wsrp:preview` mode, a Portlet should provide a rendering of its standard `wsrp:view` mode content, as a visual sample of how this Portlet will appear on the End-User's page with the current configuration. This could be useful for a Consumer that offers an advanced layout capability.

6.9.5 Custom Modes

The extensible `RegistrationData` structure provides a field for Consumers to declare additional custom modes. In addition, the extensible `PortletDescription` structure provides a field for Portlets to declare what modes they understand. The Portlet could receive a mode it does not currently support as it may have existed in a previous `PortletDescription`. A Portlet MUST map any mode it does not understand to the `wsrp:view` mode. Custom mode values are required

to be URI's in order to reduce name clashes with any values that may be defined by other parties, including future versions of this specification.

6.10 Window States

Window state is an indicator of the amount of page space that will be assigned to the content generated by a Portlet. This hint is provided by the Consumer for the Portlet to use when deciding how much information to render in the generated markup. Portlets may request window state changes either through parameters on a link that an End-User activates or by returning a newWindowState in a BlockingInteractionResponse. The Consumer SHOULD choose to respect this request to change the window state, but since the Portlet cannot depend on that choice it MUST NOT encode this new window state into any of its stateful settings. Rather, the Portlet MUST compute any such impact on stateful settings after the Consumer has actually changed the window state.

Because window states are an extensible set of values, the following semantics apply relative to determining what window states are valid for the interactions of a Consumer with a Portlet:

1. Portlets specify what window states are supported through their `PortletDescription`. The Producer determines whether or not this information is available to the Consumer prior to registration.
2. During registration the Consumer informs the Producer about window states it uses on aggregated pages.
3. After registration, the `PortletDescription` can dynamically modify the set of window states supported to incorporate those specified by the Consumer during registration.
4. The Consumer is required to use one of the window states specified by the `PortletDescription` (or the required "`wsrp:normal`" window state).

6.10.1 "wsrp:normal" Window State

The `wsrp:normal` window state indicates the Portlet is likely sharing the aggregated page with other Portlets. The `wsrp:normal` window state MAY also indicate that the target device has limited display capabilities. Therefore, a Portlet SHOULD restrict the size of its rendered output in this window state.

Conformant Portlets MUST support the `wsrp:normal` window state.

6.10.2 "wsrp:minimized" Window State

When the window state is `wsrp:minimized`, the Portlet SHOULD NOT render visible markup, but is free to include non-visible data such as JavaScript or hidden forms. The **getMarkup** operation can be invoked for the `wsrp:minimized` state just as for all other window states

6.10.3 "wsrp:maximized" Window State

The `wsrp:maximized` window state is an indication the Portlet is likely the only Portlet being rendered in the aggregated page, or that the Portlet has more space compared to other Portlets in the aggregated page. A Portlet SHOULD generate richer content when its window state is `wsrp:maximized`.

6.10.4 "wsrp:solo" Window State

The `wsrp:solo` window state is an indication the Portlet is the only Portlet being rendered in the aggregated page. A Portlet SHOULD generate richer content when its window state is `wsrp:solo`.

6.10.5 Custom Window States

The extensible `RegistrationData` structure provides a field for Consumers to declare additional custom window states. In addition, the extensible `PortletDescription` structure contains a field for Portlets to declare what window states they understand. The Portlet could receive a window state it does not currently support as it may have existed in a previous `PortletDescription`. A Portlet MUST map any window state it does not understand to `wsrp:normal`. Custom `windowState` values are required to be URI's in order to reduce name clashes with any values that may be defined by other parties, including future versions of this specification.

6.11 Defined Events

This specification defines the following events in the interest of promoting interoperability on a set of commonly encountered scenarios. All of these are defined within the WSRP types namespace (i.e. `urn:oasis:names:tc:wsrp:v2:types`)

6.11.1 onLoad

This event is to be delivered only on the first distinct use of the Portlet for a particular End-User's set of interactions with the Consumer. The Consumer determines what constitutes a distinct use of the Portlet, examples could include multiple uses of the Portlet on a particular page and reinitialization after a state loss event occurs. This event~~It~~ is to be delivered as the first invocation of the Portlet and carries no event payload. In the case of a Portlet where the initiating interaction would have been **performBlockingInteraction**, this results in two passes through the three-step nature of the protocol with the **getMarkup** step of the first pass being optimized away much as it would have been if markup had been fetched from a cache.

While this event can be a useful means for a Portlet to initialize itself, the Portlet should be prepared for situations where the Consumer chooses to not distribute this event.

6.11.2 eventHandlingFailed

This is a Consumer generated event signals ~~that~~ which the Consumer ~~detected~~ errors occurred while distributing events. As a simple notification, this event carries no predefined payload, but does use an open content definition.

6.12 User Categories

A Producer's `ServiceDescription` MAY declare support for user categories. A Consumer MAY map End-Users to the user categories a Producer declares in any manner it chooses, including ignoring them. Producers that use user categories SHOULD implement appropriate default behavior in the event a Consumer does not assert any user category for the End-User.

A Portlet optionally declares the user categories for which it personalizes markup in the `PortletDescription` structure described in section 5.1.12. The Consumer may assert any of these categories on behalf of a user. Since the Producer has no means of authenticating that the End-User belongs to one of these categories, this assertion should not be used for any security related purposes. If such an authentication is desired, standard security protocols should be employed to provide the authentication.

6.12.1 User Category Assertions

Since user categories are an optional means for the Producer and Consumer to cooperatively apply personalization that are relevant to the user, the following examines the various combinations of Producer and Consumer choices:

1. Neither Producer nor Consumer support user categories. In this case the `PortletDescription` structures from the Producer will not declare any user categories and the Consumer will never assert any user categories in the `UserContext` structure.
2. Both the Producer and Consumer support user categories. In this case the `PortletDescription` structures from the Producer will declare user categories. The Consumer will need to map its information about the user to this set from the Producer when asserting user categories in the `UserContext` structure in order to satisfy the requirement that the asserted user categories come only from the Producer published user categories. The Consumer controls the mechanism by which this mapping occurs.
3. Producer supports user categories, but the Consumer does not. In this case the `PortletDescription` structures from the Producer declare user categories, but the Consumer will never assert any user categories in the `UserContext` structure. The Producer will need to default the user category it uses to process invocations.
4. The Producer does not support user categories, but the Consumer does. In this case the `PortletDescription` structures from the Producer will not declare any user categories and the Consumer MUST NOT assert any user categories in the `UserContext` structure.

7 Registration Interface

A Producer that supports in-band registration of Consumers exposes the optional registration interface. Regardless of whether or not the registration portType is exposed, Producers can offer out-of-band processes to register a Consumer. All Producer registration processes MUST result in a unique, opaque token that may be used to refer to the registration. This specification calls this token a `registrationHandle` (defined in section 5.1.23).

7.1 Data Structures

The normative definitions for all data structures are contained in the WSDL referenced in section 18. For the convenience of the reader, this non-normative section uses an IDL like syntax to describe these structures, where the leading [R] indicates a field is required and [O] indicates it is optional. The operations in this section introduce the following data structures:

7.1.1 RegistrationData Type

The `RegistrationData` structure provides the means for the Consumer to supply the data required for registration with a Producer as well as protocol extensions that it supports [R355][R356].

```
RegistrationData
  [R] string    consumerName
  [R] string    consumerAgent
  [R] boolean   methodGetSupported
  [O] string    consumerModes[]
  [O] string    consumerWindowStates[]
  [O] string    consumerUserScopes[]
  [O] string    customUserProfileData[]
  [O] Property  registrationProperties[]
  [O] Extension extensions[]
```

Members:

- `consumerName`: A name (preferably unique) that identifies the Consumer [R355]. An example of such a name would be the Consumer's URL.

- `consumerAgent`: Name and version of the Consumer's vendor [R356]. The `consumerAgent` value MUST start with "productName.majorVersion.minorVersion" where "productName" identifies the product the Consumer installed for its deployment, and majorVersion and minorVersion are vendor-defined indications of the version of its product. This string can then contain any additional characters/words the product or Consumer wish to supply.
- `methodGetSupported`: A flag that tells the Producer whether the Consumer has implemented portlet URLs (regardless of whether they are written through Consumer URL rewriting or Producer URL writing, see section 14.2) in a manner that supports HTML markup containing forms with method="get".
- `consumerModes`: An array of modes the Consumer is willing to manage. This specification defines a set of constants for a base set of modes (see section 16). This array may reference both those constants and additional custom modes of the Consumer.
- `consumerWindowStates`: An array of window states the Consumer is willing to manage. This specification defines a set of constants for a base set of window states (see section 16). This array may reference both those constants and additional custom window states of the Consumer.
- `consumerUserScopes`: This field specifies the all the values for `UserScope` the Consumer is willing to process, including those defined by this specification. If the Consumer fails to supplies any values for this field, the Producer is free to specify any of the values defined by this specification.
- `customUserProfileData`: An array of strings each of which name a `UserProfile` extension the Consumer supports.
- `registrationProperties`: List of registration properties. The names of these properties SHOULD be from the set declared in the `registrationPropertyDescription` from the Producer's `ServiceDescription` and are not part of this specification.
- `extensions`: The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

7.2 register Operation

Registration describes how a Consumer establishes a relationship with a Producer that will be referenced via an opaque handle in subsequent invocations the Consumer makes of the Producer [R350]. Both the Consumer and the Producer are free to end this relationship at any time [R500]. When the Consumer chooses to end the relationship, it MUST attempt an invocation of the **deregister** operation so that the Producer may release related resources. When the Producer chooses to invalidate the registration identifier, it MUST inform the Consumer of this through a fault message on the next invocation specifying this `registrationHandle` so that the Consumer may release related resources.

```
RegistrationContext = register(RegistrationData, Lifetime);
Faults: MissingParameters, OperationFailed
```

If a Lifetime parameter is supplied, the Consumer is indicating a preference for the registration resource to be "leased" with the supplied value providing what the Consumer would otherwise provide on a subsequent **setRegistrationLifetime** invocation. If a Lifetime parameter is not supplied, the Consumer is indicating a preference for the registration resource to not use scheduled destruction. The returned `RegistrationContext` is used in all subsequent invocations to reference this registration [R362]. If the Producer's metadata declares registration is not supported (i.e. `requiresRegistration` flag was set to "false"), then it MUST be valid to not supply a `RegistrationContext` to operations with this parameter. Whenever the registration attempt fails a fault message MUST be thrown indicating this to the Consumer [R363].

A Producer supporting registration MUST allow a Consumer to register itself multiple times with potentially different settings (e.g. billing settings) resulting in multiple `registrationHandles` [R351].

7.3 modifyRegistration Operation

This operation provides means for the Consumer to modify a relationship with a Producer [R353].

```
RegistrationState = modifyRegistration(RegistrationContext,
                                       RegistrationData);
Faults: InvalidRegistration, MissingParameters, OperationFailed
```

The supplied parameters reference a pre-existing registration and the modifications desired. If the Producer chooses to have the Consumer provide persistent storage, the entire resulting registration state is carried in the `registrationState` field of the returned `RegistrationState` structure.

7.4 deregister Operation

The Consumer MUST NOT consider a relationship with a Producer ended until either a successful invocation of **deregister** or receipt of a `InvalidRegistration` fault message from the Producer on an invocation supplying the `registrationHandle`.

```
ReturnAny = deregister(RegistrationContext);

Faults: InvalidRegistration, OperationFailed
```

After this operation is invoked, all handles created within the context of the `RegistrationContext` become invalid [R500][R501][R503]. It is a Producer implementation choice whether this immediately aborts in-progress operations or waits until all transient resources time out. The Consumer MUST NOT use an invalidated `registrationHandle`, where the invalidation occurs either by passing the handle to **deregister** or by receiving a `InvalidRegistration` fault message from the Producer on an invocation supplying the handle. The Producer MUST return a `InvalidRegistration` fault message whenever a Consumer supplies an invalid `registrationHandle`. If the **deregister** operation fails, the Producer MUST return a fault message specifying the reason for the failure.

8 Portlet Management Interface

Producers MUST expose one or more logically distinct ways of generating markup and handling interaction with that markup [A205], which this specification refers to as Portlets. The Producer declares the Portlets it exposes through its description [A104]. This declaration contains a number of descriptive parameters; in particular it includes a `portletHandle` that Consumers use to refer to the so-called “Producer Offered Portlet”. These Portlets are pre-configured and non-modifiable by Consumers.

In addition to the Producer Offered Portlets, a Producer can expose the `PortletManagement` portType and thereby allow Consumers to clone and customize the Portlets the Producer offers. A Consumer MAY request a unique configuration of one of these Portlets, either in an opaque manner (e.g. the “edit” button common on aggregated pages which invokes a Portlet-generated page for setting the configuration) or by using the property definitions found in the Portlet’s metadata to configure it in an explicit manner [R600]. Such a configured Portlet is called a “Consumer Configured Portlet”.

Any Producer that supports cloning portlets on **performBlockingInteraction** or **handleEvents** invocations MUST support the **destroyPortlets** operation.

8.1 Data Structures

The normative definitions for all data structures are contained in the WSDL referenced in section 18. For the convenience of the reader, this non-normative section uses an IDL like syntax to describe these structures, where the leading [R] indicates a field is required and [O] indicates it is optional. The operations in this section introduce the following data structures:

8.1.1 DestroyFailed Type

The `DestroyFailed` structure contains a `portletHandle` that was not destroyed and the reason for the failure.

```
DestroyFailed
  [R] Handle   portletHandle
  [R] string   reason
```

Members:

- `portletHandle:` The `portletHandle` that was not destroyed.
- `reason:` A fault code from section 17 describing the reason the destroy failed.

8.1.2 DestroyPortletsResponse Type

The `DestroyPortletsResponse` structure carries an array of failed destroys.

```
DestroyPortletsResponse
  [O] DestroyFailed   destroyFailed[]
  [O] Extension       extensions[]
```

Members:

- `destroyFailed:` An array of failures returned by **destroyPortlets**. This is carried as a return message since not all web stacks properly handle typed information in fault messages.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

8.1.3 PortletDescriptionResponse Type

The `PortletDescriptionResponse` structure contains the fields that **getPortletDescription** can return.

```
PortletDescriptionResponse
  [R] PortletDescription     portletDescription
  [O] ResourceList           resourceList
  [O] Extension              extensions[]
```

Members:

- `portletDescription:` The metadata for the Portlet.
- `resourceList:` This is an array of `Resource` structures, each of which carries the values for a localized resource in various locales.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

8.1.4 PortletPropertyDescriptionResponse Type

The `PortletPropertyDescriptionResponse` structure contains the fields that **getPortletPropertyDescription** can return.

```
PortletPropertyDescriptionResponse
  [O] ModelDescription      modelDescription
  [O] ResourceList          resourceList
  [O] Extension             extensions[]
```

Members:

- `modelDescription`: The description of the Portlet's properties.
- `resourceList`: This is an array of `Resource` structures, each of which carries the values for a localized resource in various locales.
- `extensions`: The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

8.2 getPortletDescription Operation

This operation allows a Producer to provide information about the Portlets it offers in a context-sensitive manner.

```
PortletDescriptionResponse = getPortletDescription(RegistrationContext,
                                                   PortletContext,
                                                   UserContext,
                                                   desiredLocales);
 Faults: AccessDenied, InconsistentParameters, InvalidRegistration,
         ModifyRegistrationRequired, MissingParameters,
         OperationFailed, InvalidUserCategory, InvalidHandle
```

Producers may choose to restrict access to the information returned in `PortletDescriptionResponse` based on the supplied registration and user contexts. Consumers may choose to alter how they interact with a Portlet based on the metadata contained in the returned `PortletDescriptionResponse`. For security reasons related to exposing the existence of something the caller is not allowed to access, it is RECOMMENDED that a AccessDenied fault be generated both for the case of the supplied `portletHandle` not being a valid reference in the scope of the supplied `registrationHandle` and for the case of the user not having access to a valid reference (i.e. by definition access is denied when the Portlet reference is invalid).

When generating the `PortletDescriptionResponse` the Producer SHOULD use the `desiredLocales` to control what locales are supplied for localized strings.

8.3 clonePortlet Operation

This operation allows the Consumer to request the creation of a new Portlet from an existing Portlet.

```
PortletContext = clonePortlet(RegistrationContext, PortletContext,
                              UserContext, Lifetime);
 Faults: AccessDenied, InconsistentParameters, InvalidRegistration,
         ModifyRegistrationRequired, MissingParameters,
         OperationFailed, InvalidUserCategory, InvalidHandle
```

The supplied `PortletContext` MUST refer to either a Producer Offered Portlet or a previously cloned Consumer Configured Portlet. The initial state of the new Portlet MUST be equivalent to the state of the Portlet referenced by the supplied handle. The `PortletDescription` for the supplied `portletHandle` will apply to the newly cloned Portlet as well. In the case of a Consumer

Configured Portlet that pushes the Portlet's persistent state to the Consumer, the `portletState` field of the returned `PortletContext` structure will supply that state. The new `portletHandle` MUST be scoped by the `registrationHandle` in the supplied `RegistrationContext` and be unique within this registration.

If a Lifetime parameter is supplied, the Consumer is indicating a preference for the Portlet to be "leased" with the supplied value providing what the Consumer would otherwise provide on a subsequent **setPortletLifetime** invocation. If a Lifetime parameter is not supplied, the Consumer is indicating a preference for the Portlet to not use scheduled destruction.

If a Producer chooses to push the persistent state of its Portlets to the Consumer, it is RECOMMENDED that the `portletHandle` encode the supplied `registrationHandle`. In this case, it is also RECOMMENDED that the `portletState` encode the `portletHandle` so that the Producer can do reasonable cross checks that it is receiving a consistent set of handles and state.

The returned `PortletContext` contains both the `portletHandle` and `portletState` fields for use in subsequent invocations on the configured Portlet. No relationship between the supplied Portlet and the new Portlet is defined by this specification. The Consumer attempts to release the new `portletHandle` by invoking **destroyPortlets** when it is no longer needed.

If the Consumer has not registered, then the Consumer MUST invoke **destroyPortlets** when it would have deregistered, passing each `portletHandle` that would have been scoped by a registration.

8.4 destroyPortlets Operation

The Consumer MUST inform the Producer that a Consumer Configured Portlet will no longer be used by invoking **destroyPortlets** and MUST NOT consider a Portlet to have been destroyed until **destroyPortlets** has been successfully invoked for that Portlet.

```
DestroyPortletsResponse = destroyPortlets(RegistrationContext,
                                          portletHandles);
Faults: InconsistentParameters, InvalidRegistration,
        ModifyRegistrationRequired, MissingParameters, OperationFailed
```

The supplied `portletHandles` is an array of type `portletHandle`, each of which the Consumer is informing the Producer it will no longer use. The Producer returns failures to destroy supplied `portletHandles` in the `DestroyPortletsResponse` structure. It is a choice of the Producer's implementation whether the resources related to the `portletHandles` are immediately reclaimed or whether transient resources are allowed to timeout first. A Consumer MUST NOT reference any of the supplied `portletHandles` after successfully invoking **destroyPortlets** and MAY reclaim resources related to the supplied `portletHandles` (e.g. `portletState`).

8.5 setPortletProperties Operation

The Portlet state in the previous operations was opaque to the Consumer (e.g. as `portletState`). In addition, means are defined by which a Producer may publish information about state in a Portlet-specific manner. This is enabled through **Properties** that are declared in the metadata specific to a Portlet. Each property declaration includes a name and type (default = `xsd:string`) [A505][A507]. This operation enables the Consumer to interact with this published portion of a Portlet's state.

```
PortletContext = setPortletProperties(RegistrationContext,
                                      PortletContext, UserContext,
```

```
                                        PropertyList);
Faults: AccessDenied, InconsistentParameters, InvalidRegistration,
        ModifyRegistrationRequired, MissingParameters,
        OperationFailed, InvalidUserCategory, InvalidHandle
```

Since **setPortletProperties** is interacting only with the published portion of the Portlet's state, it is always safe for the Portlet to modify its state (i.e. equivalent to `portletStateChange` set to "`readWrite`" for a **performBlockingInteraction** invocation). The supplied set of property changes MUST be processed together. In particular, validation SHOULD only be done considering the entire set, as partial updates could easily create an internally inconsistent set of properties. The storage of the update caused by applying the set of property updates SHOULD only occur after the Producer/Portlet executes this validation. The Producer SHOULD serialize invocations of **setPortletProperties** for any one `portletHandle`. Note that changing a property's value could impact the value of any of the Portlet's properties.

8.6 getPortletProperties Operation

This operation provides the means for the Consumer to fetch the current values of the published Portlet's properties. The intention is to allow a Consumer-generated user interface to display these for administrative purposes.

```
PropertyList = getPortletProperties(RegistrationContext,
                                    PortletContext, UserContext,
                                    names);
Faults: AccessDenied, InconsistentParameters, InvalidRegistration,
        ModifyRegistrationRequired, MissingParameters,
        OperationFailed, InvalidUserCategory, InvalidHandle
```

The supplied `names` parameter is an array of strings each of which declares a property for which the Consumer is requesting its value. The returned `PropertyList` declares the current values for these properties. If the Consumer does not pass a `names` parameter, the Producer / Portlet MUST treat this as a request to enumerate the properties of the Portlet.

8.7 getPortletPropertyDescription Operation

This operation allows the Consumer to discover the published properties of a Portlet and information (e.g. type and description) that could be useful in generating a user interface for editing the Portlet's configuration.

```
PortletPropertyDescriptionResponse = getPortletPropertyDescription(
                                                RegistrationContext,
                                                PortletContext,
                                                UserContext,
                                                desiredLocales);
Faults: AccessDenied, InconsistentParameters, InvalidRegistration,
        ModifyRegistrationRequired, MissingParameters,
        OperationFailed, InvalidUserCategory,InvalidHandle
```

The `modelDescription` returned in the `PortletPropertyDescriptionResponse` structure is a typed `property` view onto the portion of the Portlet's persistent state that the user (referenced through the `userContext`) is allowed to modify. While it is possible the set of properties can change with time (e.g. the Portlet dynamically creates or destroys properties), Producers and Portlets SHOULD make the returned `modelDescription` as complete as possible.

When generating the `PortletPropertyDescriptionResponse` the Producer SHOULD use the `desiredLocales` to control which locales are supplied for localized strings.

9 CopyPortlets Interface

This interface provides the means by which a Consumer can request a Producer to generate new Portlets based on Portlets that may exist in other registrations.

9.1 Data Structures

The normative definitions for all data structures are contained in the WSDL referenced in section 18. For the convenience of the reader, this non-normative section uses an IDL like syntax to describe these structures, where the leading [R] indicates a field is required and [O] indicates it is optional. The operations in this section introduce the following data structures:

9.1.1 CopyPortletSuccess Type

The `CopyPortletSuccess` structure provides the Consumer with the details for a Portlet the **copyPortlet** operation has generated.

```
CopyPortletSuccess
  [R] Handle          fromHandle
  [R] PortletContext  newPortletContext
  [O] Extension       extensions[]
```

Members:

- `fromHandle:` The `portletHandle` used as the source for the copy operation.
- `newPortletContext:` The newly generated PortletContext.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

9.1.2 CopyPortletFailure Type

The `CopyPortletFailure` structure provides the Consumer with the details for a set of Portlets the **copyPortlets** operation failed to copy.

```
CopyPortletFailure
  [R] Handle          fromHandles[]
  [R] LocalizedString reason
  [O] Extension       extensions[]
```

Members:

- `fromHandles:` An arrays of `portletHandle` which failed to be copied for the supplied reason.
- `reason:` An explanation of what failed which is intended for display to and end-user. Note: though it is recommended that portlets with common failures be grouped into a single `CopyPortletFailure`, it is not required. I.e. it is permissible to have duplicate reasons in the failed array of the `CopyPortletsResponse`.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

9.1.3 CopyPortletsResponse Type

The `CopyPortletsResponse` structure contains the fields that **copyPortlets** can return.

```
CopyPortletsResponse
  [O] CopyPortletSuccess    copySuccess[]
  [O] CopyPortletFailure    copyFailure[]
```

```
  [0] ResourceList            resourceList
  [0] Extension               extensions[]
```

Members:

- `copySuccess:` An array returning information for the successfully copied Portlets.
- `copyFailure:` An array returning information about the Portlets where the copy failed.
- `resourceList:` This is an array of `Resource` structures, each of which carries the values for a localized resource in various locales.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

9.1.4 Reasons

The following are strings defined as reasons by this specification with their associated meanings, these should specify a language of “en”:

- `wsrp:InvalidHandle:` The supplied `portletHandle` is not valid for the operation.
- `wsrp:OperationFailed:` An attempt to process the request resulted in a failure. Whether of not a retry would likely succeed is unknown.
- `wsrp:TooManyRequested:` The request has taken all of the processing time the Producer is willing to allow.
- `wsrp:TooBusy:` The Producer has too many other processing needs to attend to the request at this time.

Additional reasons may be constructed by Producers, though automatic recovery becomes less likely with such additional definitions. As a result, the reason fields are defined as `LocalizedString` so that they are reasonable to display to administrative users.

9.2 copyPortlets Operation

This operation provides the means for the Consumer to make new copies of a portlet, including potentially specifying a different registration scope for the new portlets.

```
CopyPortletsResponse = copyPortlets(toRegistrationContext,
                                    toUserContext,
                                    fromRegistrationContext,
                                    fromUserContext,
                                    fromPortletContext[],Lifetime);
Faults:  AccessDenied, InconsistentParameters, InvalidRegistration,
         ModifyRegistrationRequired, MissingParameters,
         OperationFailed, InvalidUserCategory, InvalidHandle
```

The supplied `toRegistration` parameter provides the `RegistrationContext` that is to scope the set of new Portlets that is being requested. If the `toRegistration` parameter is not supplied, the new Portlets are to be scoped by the same `RegistrationContext` as the existing Portlets. The supplied `toUserContext` provides information concerning the End-User the Consumer is expecting to use the new portlets. A null value means the Consumer is not indicating which End-User is likely to be using the new portlets. The supplied `fromRegistration` parameter provides the `RegistrationContext` which scopes the set of Portlets supplied as the source for generating the new Portlets. The supplied `fromUserContext` provides information concerning the End-User making the request to generate the new Portlets. The `fromPortletContext` parameter specifies the set of Portlets which are to serve as the basis for generating new Portlets. The returned `CopyPortletResponse` contains information on both the set of new Portlets generated and a reason for each Portlet where the copy failed to generate a new Portlet.

If a Lifetime parameter is supplied, the Consumer is indicating a preference for the Portlets to be "leased" with the supplied value providing what the Consumer would otherwise provide on subsequent **setPortletLifetime** invocations. If a Lifetime parameter is not supplied, the Consumer is indicating a preference for the Portlets to not use scheduled destruction.

10 Import/Export Interface

This interface provides the means by which a Consumer can request a representation of a set of Portlets which can be used later to request the new Portlets be constructed from the representation. The Consumer requesting the reconstitution of Portlets from the representation is not required to be the same Consumer that requested the representation be generated.

10.1 Data Structures

The normative definitions for all data structures are contained in the WSDL referenced in section 18. For the convenience of the reader, this non-normative section uses an IDL like syntax to describe these structures, where the leading [R] indicates a field is required and [O] indicates it is optional. The operations in this section introduce the following data structures:

10.1.1 ExportedPortlet Type

The `ExportedPortlet` structure represents a single exported portlet.

```
ExportedPortlet
  [R] Handle          portletHandle
  [R] base64Binary    exportData
  [O] Extension       extensions[]
```

Members:

- `portletHandle`: The `portletHandle` of the portlet whose exported data is represented by this structure.
- `exportData`: The exported data which is required to create a copy of the Portlet using the **importPortlets** operation.
- `extensions`: The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

10.1.2 ExportPortletFailure Type

The `ExportPortletFailure` structure provides the Consumer with failure information for a set of Portlets the **exportPortlets** operation failed to export.

```
ExportPortletFailure
  [R] Handle          portletHandles[]
  [R] LocalizedString reason
  [O] Extension       extensions[]
```

Members:

- `portletHandles`: An array of `portletHandles` which all failed to be exported for the supplied `reason`.
- `reason`: Explanation of what failed which is intended for display to and end-user. Note: though it is recommended that portlets with common failures be grouped into a

single `ExportPortletFailure`, it is not required. I.e. it is permissible to have duplicate reasons in the failed array of the ExportPortletsResponse.

- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

10.1.3 ExportPortletsResponse Type

The `ExportPortletsResponse` structure contains the fields that **exportPortlets** can return. The **exportPortlets** can export many portlets in a single invocation and this structure represents the bulk response.

```
ExportPortletsResponse
  [O] base64Binary          exportcontext
  [O] ExportedPortlet       exportedPortlets[]
  [O] ExportPortletFailure  exportFailure[]
  [O] Lifetime              lifetime
  [O] ResourceList          resourceList
  [O] Extension             extensions[]
```

Members:

- `exportContext:` An opaque data structure containing common data that will be needed to import any of the successfully exported Portlets. This field is only returned if there is such common data and at least one Portlet was successfully exported.
- `exportedPortlets:` An array of `ExportedPortlet` structures where each member in the array respresents a single exported portlet.
- `exportFailure:` An array returning information about the Portlets where the export failed.
- `lifetime:` This field indicates that the exported data references data stored at the Producer and states how long the Producer intends to make this data available. If this field is not supplied, the export data contains all the information needed to import the portlets and the Consumer is solely responsible for managing its lifetime.
- `resourceList:` This is an array of `Resource` structures, each of which carries the values for a localized resource in various locales.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

10.1.4 ImportPortlet Type

The `ImportPortlet` structure represents a single exported portlet representation which the Consumer wishes to import.

```
ImportPortlet
  [R] ID              portletID
  [R] base64Binary    exportData
  [O] Extension       extensions[]
```

Members:

- `portletID:` A Consumer defined identifier for the Portlet being imported. Unlike export, where the `portletHandle` can be used to identify both the portlet to export and the resulting exported data, the import process will generate a new *portletHandle*. As Consumers still need to match requested imports with their respective reconsititued portlets, a different mechanism is needed. In this case, a Consumer defined identifier is used. Consumers supply a `portletID` with each import record. The Producer returns this `portletID` with the resultant reconsitituted `PortletContext` in the result.

By matching these `IDs`, the Consumer can properly match each returned `PortletContext` with the Consumer's intended usage.

- `exportData:` The exported representation of the portlet to be imported.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

10.1.5 ImportPortletResponse Type

The `ImportPortletResponse` structure represents a single response for the import of a Portlet representation.

```
ImportPortletResponse
  [R] ID              portletID
  [R] PortletContext  portletContext
  [O] Extension       extensions[]
```

Members:

- `portletID:` The `ID` which the Consumer supplied for identifying a particular Portlet respresentation.
- `portletContext:` The newly generated `PortletContext` representing the reconstituted Portlet.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

10.1.6 ImportPortletFailure Type

The `ImportPortletFailure` structure provides the Consumer with the details for a set of Portlets the **importPortlets** operation failed to process into reconstituted Portlets.

```
ExportPortletFailoure
  [R] ID              portletIDs[]
  [R] LocalizedString reason
  [O] Extension       extensions[]
```

Members:

- `portletID:` An array of Consumer supplied `IDs` which all failed to be imported for the supplied `reason`.
- `reason:` Explanation of what failed which is intended for display to and end-user. Note: though it is recommended that portlets with common failures be grouped into a single `ImportPortletFailure`, it is not required. I.e. it is permissible to have duplicate reasons in the failed array of the `ImportPortletsResponse`.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

10.1.7 ImportPortletsResponse Type

The `ImportPortletsResponse` structure contains the fields that **importPortlets** can return. The **importPortlets** can import many portlets in a single invocation and this structure represents the bulk response.

```
ImportPortletsResponse
  [O] ImportPortletResponse  importedPortlets[]
  [O] ImportPortletFailure   importFailure[]
  [O] ResourceList           resourceList
  [O] Extension              extensions[]
```

Members:

- `importedPortlets:` An array of `ImportPortletResponse` structures where each member in the array respresents a single imported portlet.
- `importFailure:` An array returning information about the Portlets where the import failed.
- `resourceList:` This is an array of `Resource` structures, each of which carries the values for a localized resource in various locales.
- `extensions:` The extensions field MAY be used to extend this structure. Extension elements MUST be from namespaces other than WSRP.

10.2 exportPortlets Operation

This operation allows the Consumer to get an opaque representation of a Portlet which can be supplied to the corresponding import operation to reconstitute the Portlet.

As Consumers will commonly invoke this operation when snapshoting all or a portion of itself (e.g. to package itself for deployment or migration), this operation is a bulk operation. The Consumer passes a list of Portlets it wants to obtain a representation for to **exportPortlets**. The Producer response contains exactly one element for each entry in the supplied list.

```
ExportPortletsResponse = exportPortlets(RegistrationContext,
                                        PortletContext[]
                                        UserContext,
                                        ExportByValueRequired,
                                        Lifetime);
Faults: AccessDenied, InvalidRegistration, ModifyRegistrationRequired,
        MissingParameters, OperationFailed, InvalidUserCategory,
        TooManyExportsRequested, ExportNotSupported,
        ExportByValueNotSupported
```

The supplied `RegistrationContext` sets the scope for the set of portlets requested to be exported. The array of `PortletContexts` specify the set of Portlets where exported data is being requested. The `UserContext` parameter provides information about the user making the request, `ExportByValueRequired` is a boolean parameter indicating whether or not the usage intended by the Consumer requires that the export not contain references to data stored at the Producer. If the Consumer requires the export to be ByValue and the Producer does not support such exports, the ExportByValueNotSupported fault MUST be returned.

If a Lifetime parameter is supplied, the Consumer is indicating a preference for any resources referenced by the export to be “leased” with the supplied value providing what the Consumer would otherwise provide on subsequent **setExportLifetime** invocations. If a Lifetime parameter is not supplied, the Consumer is indicating a preference for any resources referenced by the export to not use scheduled destruction.

The returned `ExportPortletsResponse` contains arrays for both the set of successfully exported Portlets and reasons for each Portlet where the export attempt failed. When not returning a fault, the Producer MUST return exactly one entry in its response for each entry in the request.

Consumers should be aware that processing invocations of **exportPortlets** may take significant time and should therefore break large bulk requests into chunks. The Producer indicates its preferred request size in the `recommendedExportSize` field of its `ServiceDescription`. Consumers SHOULD limit their export requests to chunks no larger then this size. However, even when the Consumer limits the request to this size, the Producer is free to evaluate the cost of any given request and adjust the number of portlets it exports in the response.

The Producer is responsible for identifying the correct offered Portlet to clone from during an import. Producers should be aware that the importing Producer may be in a different place, time, and version from the exporting Producer. The mechanism for identifying the correct offered Portlet should be sufficiently tolerant to work in such environments. For the same reasons, the import Producer should be capable of dealing with version differences between the representation of the Portlet in the exported data and the imported Portlet. Both of these imply a need to carry extra information in the `exportData` that allows the importing Producer to resolve such details.

10.3 importPortlets Operation

The **importPortlets** operation reconstitutes a set of previously exported Portlets.

```
ImportPortletsResponse = importPortlets(RegistrationContext,
                                        ImportContext,
                                        ImportPortlet[],
                                        UserContext, Lifetime);
Faults: AccessDenied, InconsistenParameters, InvalidRegistration,
        ModifyRegistrationRequired, MissingParameters,
        OperationFailed, InvalidUserCategory, ExportNoLongerValid,
        ImportNotSupported
```

The `ImportContext` is the `ExportContext` associated with the Portlet representations by an **exportPortlets** response. The `ImportPortlet` array identifies the Portlets to be reconstituted. The reconstituted Portlets or failure messages are returned in a corresponding array in the response. The relationship between the Portlet requested to be imported and the resulting reconstituted Portlet passed back in the response is maintained by a Consumer supplied identifier (`PortletID`).

If a Lifetime parameter is supplied, the Consumer is indicating a preference for the Portlets to be "leased" with the supplied value providing what the Consumer would otherwise provide on subsequent **setPortletLifetime** invocations. If a Lifetime parameter is not supplied, the Consumer is indicating a preference for the Portlets to not use scheduled destruction.

10.4 releaseExport Operation

The **releaseExport** operation provides the means for the Consumer to indicate to the Producer that it no longer needs to maintain any stored artifacts relative to a particular export.

```
ReturnAny = releaseExport(ExportContext);
```

All that is needed to release an export is the `ExportContext` from the original **exportPortlets** invocation. As defined, the **releaseExport** operation returns nothing to the Consumer and throws no fault. As a result, the responsibility to recover from any failures associated with the attempt to release artifacts.

10.5 setExportLifetime Operation

The **setExportLifetime** operation provides the means for the Consumer to request that the Lifetime of a particulare export be changed.

```
Lifetime = setExportLifetime(RegistrationContext, ExportContext,
                             Lifetime);

Faults: AccessDenied, InvalidRegistration, ModifyRegistrationRequired,
        OperationFailed, InvalidHandle
```

This operation is only valid when the Producer has indicated that it has stored artifacts relative to an export by having returned a `Lifetime` structure. The Consumer indicates the particular export it is requesting the lifetime change for using the `ExportContext` parameter and the desired new lifetime using the `Lifetime` parameter.

11 Registration Lifetime Interface

This interface contains the operations related to a Producer scheduling destruction of registration rather than relying solely on the Consumer to explicitly destroy registrations it is no longer using. The primary reason for a Producer to make this choice is for the purpose of cleaning up unused resources for the purpose of reducing storage needs while potentially improving performance.

11.1 getRegistrationLifetime Operation

This operation allows a Consumer to refresh its understanding of the scheduled destruction for a registration.

```
Lifetime = getRegistrationLifetime(RegistrationContext);

Faults: AccessDenied, InvalidRegistration, ModifyRegistrationRequired,
        OperationFailed, InvalidHandle
```

If the nillable response from this operation is nill, then scheduled destruction is not in use for this registration and the Consumer MUST use the **deregister** operation to destroy the registration.

11.2 setRegistrationLifetime Operation

This operation allows a Consumer to request a change to the scheduled destruction of a registration. The Producer returns the actual change that was made.

```
Lifetime = setRegistrationLifetime(RegistrationContext, Lifetime);

Faults: AccessDenied, InvalidRegistration, ModifyRegistrationRequired,
        OperationFailed, InvalidHandle
```

If the nillable `Lifetime` parameter is nill, then this is a request to not use scheduled destruction as Consumer will use the **deregister** operation to destroy the registration. A nill response indicates that the Producer is not using scheduled destruction for this registration.

12 Portlet Lifetime Interface

This interface contains the operations related to a Producer scheduling destruction of Portlets rather than relying solely on the Consumer to explicitly destroy Portlets it is no longer using. The primary reason for a Producer to make this choice is for the purpose of cleaning up unused resources for the purpose of reducing storage needs while potentially improving performance.

12.1 getPortletLifetime Operation

This operation allows a Consumer to refresh its understanding of the scheduled destruction for a Portlet.

```
Lifetime = getPortletLifetime(RegistrationContext, PortletContext);

Faults: AccessDenied, InvalidRegistration, ModifyRegistrationRequired,
```

```
        OperationFailed, InvalidHandle, InconsistentParameters
```

If the nillable response from this operation is nill, then scheduled destruction is not in use for this Portlet and the Consumer MUST use the **destroyPortlets** operation to destroy the Portlet.

12.2 setPortletLifetime Operation

This operation allows a Consumer to request a change to the scheduled destruction of a Portlet. The Producer returns the actual change that was made.

```
Lifetime = setPortletLifetime(RegistrationContext, PortletContext,
                              Lifetime);

Faults: AccessDenied, InvalidRegistration, ModifyRegistrationRequired,
        OperationFailed, InvalidHandle, InconsistentParameters
```

If the nillable `Lifetime` parameter is nill, then this is a request to not use scheduled destruction as Consumer will use the **destroyPortlets** operation to destroy the Portlet. A nill response indicates that the Producer is not using scheduled destruction for this Portlet.

---

13 Security

Systems compliant with this specification will be exposed to the same security issues as other web service systems. For a representative summary of security concerns, refer to the Security and Privacy Considerations document produced by the XML-Based Security Services Oasis TC. One area to particularly note is that security information, including fields within the WSRP protocol that relate to a need for secure communication, is only as trustworthy as the means used to transmit the information.

It is a goal within this specification to leverage standards efforts that address web services security and to avoid defining mechanisms that will be redundant with those standards efforts. These standards generally fall into two main categories: document-level mechanisms and transport-level mechanisms.

The uses of document-level security mechanisms are not covered in this version of the specification since several important standards (in particular, security policy declarations) are not yet available. Producers and Consumers wishing to apply document-level security techniques are encouraged to adhere to the mechanisms defined by WS-Security, SAML, XML-Signature, XML-Encryption, and related specifications. It is anticipated that as the web services security roadmap becomes more fully specified by standards, and support for those standards becomes widely available from infrastructure components, that these will play an important role in future versions of this specification.

For this version of the specification, emphasis is placed on using transport-level security standards (e.g. SSL/TLS) to address the security issues involved in Consumers invoking Producers on behalf of End-Users. These only require that a Producer's WSDL declare ports for an HTTPS service entry point. Consumer's can only determine that secure transport is supported by parsing the URL for the service entry point.

13.1 Authentication of Consumer

Producer authentication of a Consumer may be achieved at the transport level through the use of client certificates in conjunction with SSL/TLS. Certificate provisioning by a Producer to a

Consumer happens outside the scope of this protocol, typically as part of establishing a business relationship between the Producer and Consumer.

13.2 Confidentiality & Message Integrity

SSL/TLS may be used to ensure the contents of messages are neither tampered with nor decipherable by an unauthorized third party. Consideration needs to be given to both the communication between Producer and Consumer and communication between the End-User client and the Consumer.

For Producer - Consumer communication, the Producer declares the use of SSL/TLS in the service's WSDL by declaring an HTTPS service endpoint.

For Consumer – End-User client communication, the Consumer indicates in the `MarkupParams` structure whether or not communication with the End-User is happening in a secure manner. The Portlet can choose to change behavior based on this value, for example it may generate markup that redirects the End-User to the equivalent secure page or throw a fault indicating secure client communication are required.

13.3 Access control

A Consumer can implement access control mechanisms that restrict which End-Users may access which Portlets and operations on those Portlets. Additionally, a Producer can implement access control programmatically through the use of facilities such as an authenticated user identity.

---

14 Markup

This section covers the issues related to Portlets generating markup that Consumers could safely aggregate into a page and then properly process End-User interactions with the resulting aggregated page [A301].

14.1 Encoding

The Consumer indicates to the Portlet the preferred character encoding, using the `markupCharacterSets` field of the `MarkupParams` structure. It is up to the Portlet to generate markup that complies with this encoding. The Portlet is allowed to generate its markup in either the UTF-8 or UTF-16 character set encoding if it is unable to generate the requested character set. If it is unable to generate markup in any of these character sets, the Portlet MUST return a fault message to the Consumer. When the SOAP binding is in use, the nature of XML requires that the markup use the same character set as the XML response message.

14.2 URL Considerations

As part of its markup, a Portlet will often need to create URLs that reference the Portlet itself. When an End-User activates such an URL, by clicking a link or submitting a form, the result should be a new invocation targeted to the Portlet. This section describes the different possibilities for how the Portlet can encode these "portlet URLs" in its markup.

The portlet URLs embedded in a markup fragment often can not (or should not) be direct links to the Producer for a number of reasons:

- URLs the Portlet writes in its markup will be invoked or accessed by the End-User operating on the client. In the general case however it is only guaranteed that the client has direct access to the Consumer; the Producer may be shielded from the client via a firewall. So the Consumer needs to intercept URLs and route them to the Producer [A103].
- The Consumer may want to intercept URLs to perform additional operations, enrich the request with context information or do some book keeping.
- The client might not be able to directly invoke the Producer, e.g. if the client is a user-agent that cannot issue SOAP requests to the Producer but can only talk HTTP to the Consumer. In this case the Consumer must translate the request into the correct protocol.

This implies that portlet URLs must be encoded so that the Consumer intercepts them and re-routes them to the correct Portlet at the Producer, including the proper context. Because the same Portlet can be instantiated more than once in a single aggregated page, portlet URLs will have to allow the Consumer to track the Portlet to which the request is targeted. The problem is that the Producer requires Consumer-dependent information to write such a link. In principle there exist two options to make a portlet URL point back to the Consumer and consist of all information necessary for the Consumer to properly process an activation of the URL:

- The Consumer can pass information on its context to the Portlet. The Portlet exploits this information during URL encoding so the resulting URL can be passed without further modification to the client. The advantages of this technique are efficiency and exploitation of these settings, even in client-side scripting. The disadvantages include that the Portlet will not be able to serve static content as the content depends on Consumer runtime settings and that the resulting markup might be less cacheable by the Consumer.
- The Portlet can use a special syntax to encode portlet URLs. It is then the task of the Consumer to detect portlet URLs in the markup and modify them according to its requirements. The markup generated by the Portlet is now Consumer-independent, allowing the Portlet to exploit caching mechanisms or even to serve static content. However, the Consumer will be more complex, as it needs to parse the markup to locate and rewrite portlet URLs, and require additional processing time. Consumers can minimize this impact on performance by using efficient encoding and parsing mechanisms (for example, the Boyer-Moore algorithm[17]).

As there is no clear advantage to either technique, both styles of portlet URL encoding are supported (see sections 14.2.1 and 14.2.2). This facilitates the capabilities both of the Producer and the Consumer with regards to the ability to adapt the generated markup and requires that the following semantics be followed:

1. If a Portlet's metadata declares it is willing to process URL templates, then the Consumer supplies templates for the Portlet to use.
2. As the Portlet writes URLs into the markup it MUST encode them based on the mime type. For example, XML based markup requires that all '&' characters have to be encoded as "&".
3. If a Portlet is unable to completely write the portlet URLs for its markup, it MUST set the `requiresUrlRewriting` flag in the returned `MarkupContext` structure to "true".
4. If the `requiresUrlRewriting` flag in the `MarkupContext` structure is "true", then the Consumer parses the returned markup and rewrites URLs conforming to the definitions in Section 9 of this specification.

[17] http://www.cs.utexas.edu/users/moore/best-ideas/string-searching/

Note: In principle it would not be necessary to mark portlet URLs in a special way. The Consumer could always analyze the markup semantically and syntactically, detect portlet URLs and rewrite them. This approach however would be very difficult and time consuming to implement for the Consumer, for reasons including that such a rewriting algorithm would be dependent on the markup type and version. Therefore both the Consumer and the Producer URL writing scenarios are introduced for convenience.

Portlets MUST adopt the following convention for including non-ASCII characters within portlet URLs in order to comply with W3C recommendations.

1. Represent each character in UTF-8 (see [RFC2279]) as one or more bytes.
2. Escape these characters with the URI escaping mechanism (i.e., by converting each byte to %HH, where HH is the hexadecimal notation of the character value).

This procedure results in a syntactically legal URI (as defined in RFC1738, section 2.2 or RFC2141, section 2) that is independent of the character encoding[18] to which the document carrying the URI may have been transcoded.

Since the values a Portlet provides will appear as either an URL parameter value or as part of the path of an URL, these values it MUST be strictly encoded (i.e. “&”, “=“, “/”, and “?” need to be url-escaped) so that special URL characters do not invalidate the processing of the enclosing URL.

When URL activation occurs, the Consumer MUST process all mode and window state change requests and either honor and reject them prior to invoking the operation indicated by the URL. If the requested mode or window state is for a value that is either invalid or unavailable, the Consumer SHOULD leave the current value unchanged.

14.2.1 Consumer URL Rewriting

All portlet URLs (i.e. those the Consumer needs to rewrite) are demarcated in the markup by a token (wsrp_rewrite) both at the start (with a “?” appended to clearly delimit the start of the name/value pairs) and end (proceeded by a “/” to form the end token) of the URL declaration. The Consumer will have to locate the start and end token in the markup stream and use the information between the tokens to rewrite the portlet URL correctly. Details on this URL writing process are Consumer-specific and out of scope for this specification. The content between this pair of tokens follows the pattern of a query string (name/value pairs separated by “&” characters) with several well-known “portlet URL parameter” names specifying the information the Consumer needs in order to both correctly rewrite the URL and then process it when an End-User activates it. This results in an portlet URL declaration of the form:

```
wsrp_rewrite?wsrp-urlType=value&name1=value1&name2=value2
.../wsrp_rewrite
```

Consumers MUST accept both the “&” character and the corresponding entity reference (i.e. “&”) as separators between the name/value pairs as this allows portlets to produce markup fragments valid for a larger range of mime types. We encourage Portlets to use the entity reference form (“&”) in static markup as this is likely to result in the ability to include that markup in a larger set of enclosing mime types.The Consumer is NOT REQUIRED to process URLs not conforming to this format and MAY choose to pass them unchanged, replace them with error text, do a best effort processing or invalidate the entire markup fragment. The Consumer is NOT REQUIRED to process escaped characters in parameter names or values, but rather MAY

[18] http://www.w3.org/TR/html40/charset.html - doc-char-set

pass them unchanged to either the user-agent (during URL rewriting) or the Producer (during processing of an activated URL).

The following well-known portlet URL parameter names (e.g. replacing "*wsrp-urlType*=value", "name1" and "name2" above) are defined:

14.2.1.1 wsrp-urlType

This parameter MUST be specified first when using the Consumer URL rewriting template and the value selected from the following definitions. Well-known portlet URL parameter names that are valid for only one `wsrp-urlType` are described relative to that `wsrp-urlType` while the remainder are described later. The following values are defined for `wsrp-urlType`:

14.2.1.1.1 wsrp-urlType = blockingAction

Activation of the URL will result in an invocation of **performBlockingInteraction** on the Portlet that generated the markup. All form parameters, submitted as query string parameters using the HTTP GET method, that are not used to encode parameters defined by this specification MUST be passed to **performBlockingInteraction** as `formParameters`.

14.2.1.1.2 wsrp-urlType = render

Activation of the URL will result in an invocation of **getMarkup**. This mechanism permits a Portlet's markup to contain URLs, which do not involve changes to local state, to avoid the overhead of two-step processing by directly invoking **getMarkup**. The URL MAY specify a `wsrp-navigationalState` portlet URL parameter, whose value the Consumer MUST supply in the `navigationalState` field of the `MarkupParams` structure. If there is no such portlet URL parameter, the Consumer MUST NOT supply a value for this field.

14.2.1.1.3 wsrp-urlType = resource

Activation of the URL will result in the Consumer acting as a gateway to the underlying resource, possibly in a cached manner, and returning it to the user-agent. The URL for the resource (including any query string parameters) is encoded as the value of the `wsrp-url` parameter. When a portlet URL specifies "resource" for the `wsrp-urlType` portlet URL parameter, both the `wsrp-url` and `wsrp-requiresRewrite` portlet URL parameters MUST also be specified. If the Portlet needs to share data with the referenced resource, it can exploit the cookie support defined in section 14.4.

14.2.1.1.3.1 wsrp-url

This parameter provides the actual URL to the resource. Note that this needs to be an absolute URL as the resource fetch will have no base for use in fetching a relative URL. Also note that since this resource URL will appear as a parameter value, it has to be strictly encoded (i.e. "&", "=", "/", and "?" need to be url-escaped) so that special URL characters do not invalidate the processing of the enclosing URL. Consumers are strongly encouraged to use the same communication style (e.g. HTTP Get or Post) for retrieving the resource as was used in requesting the resource by the user-agent.

14.2.1.1.3.2 wsrp-resourceID

This parameter provides the resourceID parameter which the Consumer MUST supply when invoking the **getResource** operation. The presence of this parameter informs the Consumer that the **getResource** operation is a viable means of fetching the resource requested by the Portlet's markup.

14.2.1.1.3.3 wsrp-preferOperation

When this optional parameter (default value is `false`) has a value of `true`, the Portlet is indicating a preference for the Consumer to use the **getResource** operation to fetch the resource. If the resource URL specifies both the wsrp-url and the wsrp-resourceID parameters, the Consumer can use either the http proxy technique introduced in WSRP v1.0 or the **getResource** operation, but is encouraged to follow the guidance provided by this url parameter.

14.2.1.1.3.4 wsrp-requiresRewrite

This boolean informs the Consumer that the resource needs to be parsed for URL rewriting. Normally this means that there are names that will be cross-referenced between the markup and this resource (e.g. JavaScript references). Note that this means the Consumer needs to deal with rewriting unique “namespaced” names in a set of documents, rather than treating each document individually. Processing such resources in a manner that allows caching of the resulting resource by the End-User’s user-agent can improve the performance of the aggregated page for the End-User. In particular, Consumers can process namespace rewriting by using a prefix that is unique to the user/Portlet pair provided any such prefix is held constant for the duration of use within the user’s session with the Consumer of any one Portlet.

14.2.1.2 wsrp-navigationalState

The value of this portlet URL parameter defines the navigational state the Consumer MUST send to the Producer when the URL is activated. If this parameter is missing, the Consumer MUST NOT supply the `navigationalState` field of the `MarkupParams`.

14.2.1.3 wsrp-interactionState

The value of this portlet URL parameter defines the interaction state the Consumer MUST send to the Producer when the URL is activated. If this parameter is missing, the Consumer MUST NOT supply the `interactionState` field of the `InteractionParams` structure.

14.2.1.4 wsrp-mode

Activating this URL includes a request to change the `mode` parameter in `MarkupParams` into the mode specified as the value for this portlet URL parameter. The value for `wsrp-mode` MUST be one of the modes detailed in section 6.9 or a custom mode the Consumer specified as supported during registration. The `wsrp-mode` portlet URL parameter MAY be used whenever the `wsrp-urlType` portlet URL parameter has a value of “blockingAction” or “render”.

14.2.1.5 wsrp-windowState

Activating this URL includes a request to change the `windowState` parameter in `MarkupParams` into the window state specified as the value for this portlet URL parameter. The value for `wsrp-windowState` MUST be one of the values detailed in section 6.10 or a custom window state the Consumer specified as supported during registration. The `wsrp-windowState` portlet URL parameter MAY be used whenever the `wsrp-urlType` portlet URL parameter has a value of “blockingAction” or “render”.

14.2.1.6 wsrp-fragmentID

This portlet URL parameter specifies the portion of an URL that navigates to a place within a document.

14.2.1.7 wsrp-secureURL

The value for the `wsrp-secureURL` is a boolean indicating whether the resulting URL MUST involve secure communication between the client and Consumer, as well as between the Consumer and Producer. The default value of this boolean is “false”. Note that the Consumer’s aggregated page MUST be secure if any of the Portlets whose content is being displayed on the page have indicated the need for secure communication for their current markup.

14.2.1.8 URL examples

Here are some examples of portlet URLs following this format:

- Load a resource http://test.com/images/test.gif:
  - wsrp_rewrite?wsrp-urlType=resource&wsrp-url=http%3A%2F%2Ftest.com%2Fimages%2Ftest.gif&wsrp-requiresRewrite=true/wsrp_rewrite
- Declare a secure interaction back to the Portlet:
  - wsrp_rewrite?wsrp-urlType=blockingAction&wsrp-secureURL=true&wsrp-navigationalState=a8h4K5JD9&wsrp-interactionState=fg4h923mdk/wsrp_rewrite
- Request the Consumer render the Portlet in a different mode and window state:
  - wsrp_rewrite?wsrp-urlType=render&wsrp-mode=help&wsrp-windowState=maximized/wsrp_rewrite

14.2.2 Producer URL Writing

To enable Producer URL writing, several templates are defined by which the Consumer indicates how it needs portlet URLs formatted in order to process them properly. These all take the form of a simple template, for example:

```
http://www.Consumer.com/path/{wsrp-urlType}?mode={wsrp-mode}&amp;…
```

The definition of the content of this template is completely up to the Consumer. It may consist of zero or more replacement tokens. These tokens are enclosed in curly braces (i.e. “{” and “}”) and contain the name of the portlet URL parameter which the Producer MUST replace (using "" for those parameters where the Producer has no value). This replacement includes the curly braces, namely; “{wsrp-urlType}” becomes “render” when that is the desired URL type. All content outside the {} pairs MUST be treated by the Producer/Portlet as constants the Consumer needs to receive when the portlet URL is activated. The list of defined portlet URL parameter names matches those in section 14.2.1 with the addition of those specified in section 14.2.2.9.

Portlets dynamically computing portlet URLs in the user-agent environment (e.g. in JavaScript) need to take into account the distributed nature of preparing and processing portlet URLs. The Consumer’s template might not directly produce a valid URL, but may be such that the Consumer further processes the portlet URL for its own purposes (e.g. adds data it needs when the portlet URL is activated which has not been supplied to the Producer). As a result, the only safe means to accommodate this computation of dynamic URLs is to store the template(s) whole in the markup and then use this template directly when computing the dynamic portlet URL.

This specification defines a `Templates` structure that supplies values for the set of defined templates. The Consumer supplies these templates for Portlets specifying `doesUrlTemplateProcessing` as “true”. Portlets also specifying `templatesStoredInSession` as “true” enable the Consumer to only send these until the Producer returns a `sessionID`. The following describe in more detail the usage of the fields from the `Templates` structure.

14.2.2.1 blockingActionTemplate

Activation of the URL will result in an invocation of **performBlockingInteraction**. The Consumer MUST integrate placeholders for at least the portlet URL parameters `wsrp-navigationalState`, `wsrp-interactionState`, `wsrp-mode` and `wsrp-windowState` in its template and SHOULD integrate placeholders for the other portlet URL parameters defined in this specification.

14.2.2.2 secureBlockingActionTemplate

secureBlockingActionTemplate is equivalent to blockingActionTemplate, but using secure communication.

14.2.2.3 renderTemplate

Activation of the URL will result in an invocation of **getMarkup**. The Consumer MUST integrate placeholders for at least the portlet URL parameters `wsrp-navigationalState`, `wsrp-mode` and `wsrp-windowState` in its template.

14.2.2.4 secureRenderTemplate

`secureRenderTemplate` is equivalent to `renderTemplate`, but using secure communication.

14.2.2.5 resourceTemplate

Activation of the URL will result in the Consumer fetching the underlying resource, possibly in a cached manner, and returning it to the End-User. The Consumer MUST integrate placeholders for at least the portlet URL parameters `wsrp-url`, `wsrp-preferOperation`, `wsrp-requiresRewrite` and `wsrp-navigationalState` to allow the Portlet to place all the pieces of information it could use for accessing a resource. If the Portlet needs to share data with a resource when the `wsrp-preferOperation` has a value of `false`, it can either supply the data on the URL to the resource or exploit the cookie support defined in section 14.4.

14.2.2.6 secureResourceTemplate

`ResourceTemplate` is equivalent to `ResourceTemplate`, but using secure communication.

14.2.2.7 defaultTemplate

This is the template whose value is to be used as the default value for any non-secure template whose value is not supplied. Consumers not supplying all the other non-secure templates MUST set a value for this template. Since this may become the value for an action oriented template, the Consumer SHOULD integrate placeholders for at least the portlet URL parameters `wsrp-navigationalState`, `wsrp-interactionState`, `wsrp-mode` and `wsrp-windowState` in this template.

14.2.2.8 secureDefaultTemplate

This is the template whose value is to be used as the default value for any secure template (i.e. those with names beginning with “secure”) whose value is not supplied. Consumers not supplying all the other secure templates MUST set a value for this template. Since this may become the value for an action oriented template, the Consumer SHOULD integrate placeholders for at least the portlet URL parameters `wsrp-navigationalState`, `wsrp-interactionState`, `wsrp-mode` and `wsrp-windowState` in this template.

14.2.2.9 Portlet URL parameters

The following portlet URL parameters are defined for the purpose of enabling a Consumer's templates to be generic to a Producer. If the Consumer includes `wsrp-portletHandle`, `wsrp-userContextKey, wsrp-portletInstanceKey` or `wsrp-sessionID` in a template, Producer written URLs based on that template MUST replace the specified portlet URL parameter with the value the Consumer separately supplied in a data field.

Portlet URL parameter name	Structure name	Field name
wsrp-portletHandle	`PortletContext`	`portletHandle`
wsrp-userContextKey	`UserContext`	`userContextKey`
wsrp-portletInstanceKey	`RuntimeContext`	`portletInstanceKey`
wsrp-sessionID	`RuntimeContext`	`sessionID`

14.2.3 BNF Description of URL formats

```
ConsumerURL = BeginToken UrlTypePair NameValuePairs EndToken
  BeginToken = "wsrp_rewrite?"
  EndToken = "/wsrp_rewrite"
  UrlTypePair = "wsrp-urlType" "=" UrlType
  UrlType = "blockingAction" | "render" | "resource"
  NameValuePairs = ( ("&" | "&amp;") NameValuePair)*
  NameValuePair = TextPair | BooleanPair
  TextPair = TextName "=" Text
  TextName = "wsrp-navigationalState" | "wsrp-interactionState" | "wsrp-mode" | "wsrp-windowState" | "wsrp-url" | "wsrp-fragmentID"
  Text = <any URL-encoded textual characters>
  BooleanPair = BooleanName "=" BooleanValue
  BooleanName = "wsrp-secureURL" | "wsrp-requiresRewrite" | "wsrp-preferOperation"
  BooleanValue = ("true" | "false")

  ProducerURLTemplate = (Text* ReplacementToken*)*
  ReplacementToken = "{" ParameterName "}"
  ParameterName = TextName | BooleanName | "wsrp-urlType" | "wsrp-portletHandle" | "wsrp-userContextKey" | "wsrp-portletInstanceKey" | "wsrp-sessionID"
```

14.2.4 Method=get in HTML forms

User-Agents often throw away any query string from the URL indicated with the form's action attribute when generating the URL they will activate when the form's method is "get". This is the simplest means for them to generate a valid query string. The difficulty this causes is that Consumer's often prefer to store the information they will use when a portlet URL is activated as query string parameters. As a result, Portlets that include HTML forms with method=get in their markup MUST specify `usesMethodGet` as "true" in their `PortletDescription`. Consumers choosing to use such Portlets need to format their portlet URLs such that portlet URL activations are processed correctly, regardless of whether Consumer or Producer URL writing is in use.

14.3 Namespace Encoding

Aggregating multiple Portlets from different sources can potentially result in naming conflicts for various types of elements: named attributes, JavaScript functions and variables, etc. Tokens needing uniqueness on the aggregated page MUST be encoded to a Portlet-instance specific namespace [A301]. The Portlet MAY do this by prefixing the name of the resource with the `namespacePrefix` from the `RuntimeContext` structure. We note that the JavaScript examples exclude the possibility of starting such prefixes with a numerical character.

Consumer URL and form processing has been designed so that namespace prefixing is not needed to qualify portlet URL parameters, portlet form parameters, or resource URL parameters. This allows Consumers to avoid unnecessary processing when dispatching client requests. Portlets choosing to namespace such elements MUST process these parameters with their namespace prefix attached as Consumers MUST NOT remove any prefixes. We would note that many things Producers and Portlets could namespace, such as field names in HTML forms, are not required to be unique and therefore are preferably not namespaced as this adds processing burden to generate and remove the namespacing. This likely has an impact on client side code that may currently use such items to locate items on the page. In the case of field names within HTML forms, we would note that namespacing an id attribute and using it to locate the field provides the desired uniqueness within the aggregated environment without introducing a processing burden as would be caused if the name attribute were namespaced instead.

Similar to the case of URL rewriting, two options exist to obtain a namespace prefix.

14.3.1 Consumer Rewriting

The Portlet can prefix the token with “wsrp_rewrite_”. The Consumer will locate such markers and MUST replace them with a prefix that is unique to this instance of this portlet on the page. This prefix has been chosen such that the Consumer is able to do a single parse of the markup to both locate such markers and the URL rewrite expressions described in section 10.2.1. In addition, this prefix is legal for at least the JavaScript and VBScript scripting languages and CSS class names. This permits the independent testing of most generated markup fragments.

14.3.2 Producer Writing

The Portlet uses the `namespacePrefix` provided by the Consumer in the `RuntimeContext` structure to prefix these tokens in its markup.

14.4 Using Resources

There are times when a resource which a portlet references needs access to data relative to the interactions of the End-User with the Portlet. While this version of the specification does not seek to address this need in a comprehensive manner, we note that a solution already exists for the common case of HTTP being the protocol for communication. Producers can set cookies with the needed data which the Consumer will then process, using the cookie rules established by RFC2109[19], relative to forwarding these to resources referenced by the Portlet.

14.5 Markup Fragment Rules

Because the Consumer aggregates the markup fragments produced by Portlets into a single page, some rules and limitations are needed to ensure the coherence of the resulting page to be displayed to the End-User. For efficiency reasons, Consumers are not required to validate the

[19] http://www.ietf.org/rfc/rfc2109.txt

markup fragments returned by the Portlet. So in order to be aggregated, the Portlet's markup needs to conforms to the following general guidelines [A300][A302].

The disallowed tags listed below are those tags that impact other Portlets or may even break the entire aggregated page. Inclusion of such a tag invalidates the whole markup fragment, which the Consumer MAY replace with an error message.

14.5.1 HTML

14.5.1.1 Disallowed Tags

Since the Consumer may implement its aggregation in many ways, including using frames, some Consumers may actually support these disallowed tags. However, in order to be a conforming Portlet, a Portlet MUST NOT use the tags <body>, <frame>, <frameset>, <head>, <html>, and <title>.

14.5.1.2 Other Tags

There are some tags that are specifically prohibited by the HTML specification from occurring outside the <head> of the document. However, user-agent implementations offer varying levels of support. For example, current versions of Internet Explorer and Netscape Navigator both support the style tag anywhere within the document.

It is up to the Portlet developer to decide when using such tags is appropriate. Tags fitting this description include <base>, <link>, <meta>, and <style>.

14.5.2 XHTML

14.5.2.1 Disallowed Tags

Since the Consumer may implement its aggregation in many ways, including using frames, some Consumers may actually support these disallowed tags. However, in order to be a conforming Portlet, a Portlet MUST NOT use the tags <body>, <head>, <html>, and <title>.

14.5.2.2 Other Tags

There are some tags that are specifically prohibited by the XHTML specification from occurring outside the <head> of the document. However, user-agent implementations offer varying levels of support. For example, current versions of Internet Explorer and Netscape Navigator both support the style tag anywhere within the document.

It is up to the Portlet developer to decide when using such tags is appropriate. Tags fitting this description include <base>, <link>, <meta>, and <style>.

14.5.3 XHTML Basic

14.5.3.1 Disallowed Tags

Since the Consumer may implement its aggregation in many ways, including using frames, some Consumers may actually support these disallowed tags. However, in order to be a conforming Portlet, a Portlet MUST NOT use the tags <body>, <head>, <html>, and <title>.

14.5.3.2 Other Tags

There are some tags that are specifically prohibited by the XHTML Basic specification from occurring outside the <head> of the document. However, user-agent implementations offer varying levels of support. For example, current versions of Internet Explorer and Netscape Navigator both support the style tag anywhere within the document.

It is up to the Portlet developer to decide when using such tags is appropriate. Tags fitting this description include <base>, <link>, <meta>, and <style>.

14.6 CSS Style Definitions

One of the goals of an aggregated page is a common look-and-feel across the Portlets contained on that page. This not only affects the decorations around the Portlets, but also their content. Using a common CSS style sheet for all Portlets, and defining a set of standard styles, provides this common look-and-feel without requiring the Portlets to generate Consumer-specific markup. Portlets SHOULD use the CSS style definitions from this specification in order to participate in a uniform display of their content by various Consumers. For markup types that support CSS stylesheets, Consumers MUST supply a CSS stylesheet to the End-User's agent with definitions for the classes defined in section 14.6 of this specification.

This section defines styles for a variety of logical units in the markup.

14.6.1 Links (Anchor)

A custom CSS class is not defined for the <a> tag. The Portlet should use the default classes when embedding anchor tags.

14.6.2 Fonts

The font style definitions affect the font attributes only (i.e. font face, size, color, style, etc.).

Style	Description	Example
portlet-font	Font attributes for the "normal" fragment font. Used for the display of non-accentuated information.	Normal Text
portlet-font-dim	Font attributes similar to the portlet-font but the color is lighter.	Dim Text

If a Portlet author wants a certain font type to be larger or smaller, they should indicate this using a relative size.

Example1: Important information

Example2: Small and dim

14.6.3 Messages

Message style definitions affect the rendering of a paragraph (i.e. alignment, borders, background color, etc.) as well as text attributes.

Style	Description	Example
portlet-msg-status	Status of the current operation.	Progress: 80%
portlet-msg-info	Help messages, general additional information, etc.	Info about

portlet-msg-error	Error messages.	Portlet not available
portlet-msg-alert	Warning messages.	Timeout occurred, try again later
portlet-msg-success	Verification of the successful completion of a task.	Operation completed successfully

14.6.4 Sections

Section style definitions affect the rendering of markup sections such as div and span (i.e. alignment, borders, background color, etc.) as well as their text attributes.

Style	Description
portlet-section-header	Section header
portlet-section-body	Normal text
portlet-section-alternate	Text in every other row in the section
portlet-section-selected	Text in a selected range
portlet-section-subheader	Text of a subheading
portlet-section-footer	Section footer
portlet-section-text	Text that belongs to the section but does not fall in one of the other categories (e.g. explanatory or help text that is associated with the section).

14.6.5 Tables

5 Table style definitions affect the rendering (i.e. alignment, borders, background color, etc.) as well as their text attributes.

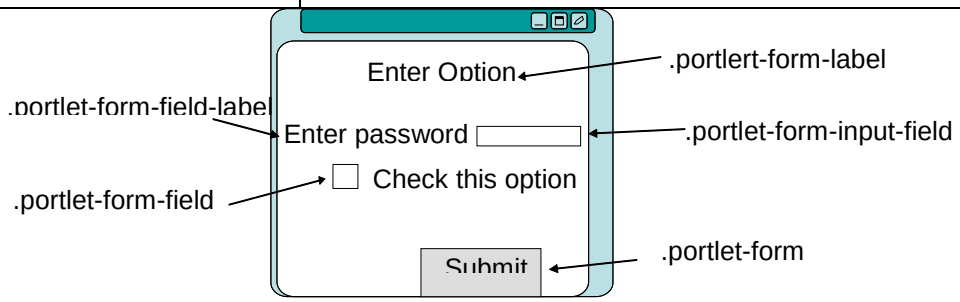
Style	Description
portlet-table-header	Table header
portlet-table-body	Normal text in a table cell
portlet-table-alternate	Text in every other row in the table
portlet-table-selected	Text in a selected cell range
portlet-table-subheader	Text of a subheading
portlet-table-footer	Table footer
portlet-table-text	Text that belongs to the table but does not fall in one of the other categories (e.g. explanatory or help text that is associated with the table).

14.6.6 Forms

Form styles define the look-and-feel of the elements in an HTML form.

Style	Description

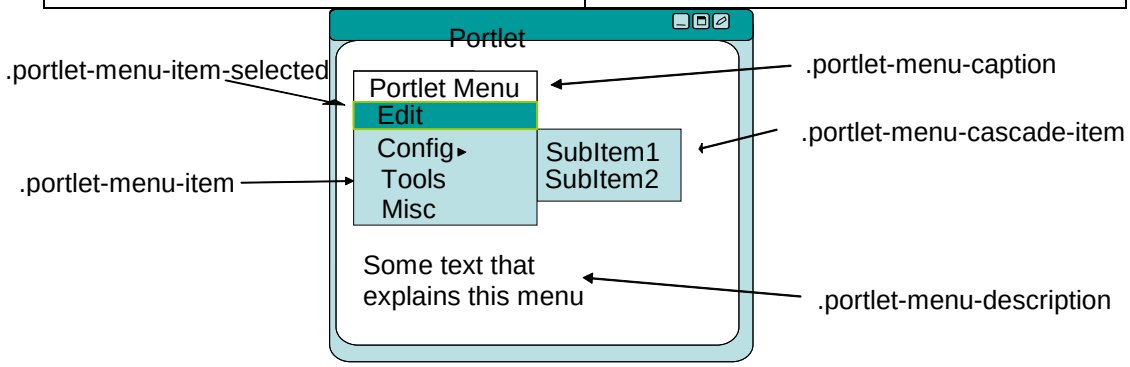
portlet-form-label	Text used for the descriptive label of the whole form (not the labels for fields.
portlet-form-input-field	Text of the user-input in an input field.
portlet-form-button	Text on a button
portlet-icon-label	Text that appears beside a context dependent action icon.
portlet-dlg-icon-label	Text that appears beside a “standard” icon (e.g. Ok, or Cancel)
portlet-form-field-label	Text for a separator of fields (e.g. checkboxes, etc.)
portlet-form-field	Text for a field (not input field, e.g. checkboxes, etc)



14.6.7 Menus

Menu styles define the look-and-feel of the text and background of a menu structure. This structure may be embedded in the aggregated page or may appear as a context sensitive popup menu.

Style	Description
portlet-menu	General menu settings such as background color, margins, etc
portlet-menu-item	Normal, unselected menu item.
portlet-menu-item-selected	Selected menu item.
portlet-menu-item-hover	Normal, unselected menu item when the mouse hovers over it.
portlet-menu-item-hover-selected	Selected menu item when the mouse hovers over it.
portlet-menu-cascade-item	Normal, unselected menu item that has sub-menus.
portlet-menu-cascade-item-selected	Selected sub-menu item that has sub-menus.
portlet-menu-description	Descriptive text for the menu (e.g. in a help context below the menu)
portlet-menu-caption	Menu caption



5

15 User Information

This specification provides a mechanism for Portlets to use End-User information as a means for personalizing behavior to the current user [A600][A606]. A standard set of user attributes has been derived from P3P User Data. Extensibility is supported in both directions; the Consumer indicates to the Producer during registration what set of user profile extensions it supports, and a Portlet's metadata declares what user profile items it uses (including any extended user profile items). The following table maps the nested profile structures to `userProfileItems`:

Profile Name	Structure 1	Structure 2	Structure 3	Field Name
name/prefix	PersonName			prefix
name/given	PersonName			given
name/family	PersonName			family
name/middle	PersonName			middle
name/suffix	PersonName			suffix
name/nickname	PersonName			nickname
bdate				bdate
gender				gender
employerInfo/employer	EmployerInfo			employer
employerInfo/department	EmployerInfo			department
employerInfo/jobtitle	EmployerInfo			jobtitle
homeInfo/postal/name	Contact	Postal		name
homeInfo/postal/street	Contact	Postal		street
homeInfo/postal/city	Contact	Postal		city
homeInfo/postal/stateprov	Contact	Postal		stateprov
homeInfo/postal/postalcode	Contact	Postal		postalcode
homeInfo/postal/country	Contact	Postal		country
homeInfo/postal/organization	Contact	Postal		organization
homeInfo/telecom/telephone/intcode	Contact	Telecom	TelephoneNum	intcode
homeInfo/telecom/telephone/loccode	Contact	Telecom	TelephoneNum	loccode
homeInfo/telecom/telephone/number	Contact	Telecom	TelephoneNum	number
homeInfo/telecom/telephone/ext	Contact	Telecom	TelephoneNum	ext
homeInfo/telecom/telephone/comment	Contact	Telecom	TelephoneNum	comment
homeInfo/telecom/fax/intcode	Contact	Telecom	TelephoneNum	intcode
homeInfo/telecom/fax/loccode	Contact	Telecom	TelephoneNum	loccode

homeInfo/telecom/fax/number	Contact	Telecom	TelephoneNum	number
homeInfo/telecom/fax/ext	Contact	Telecom	TelephoneNum	ext
homeInfo/telecom/fax/comment	Contact	Telecom	TelephoneNum	comment
homeInfo/telecom/mobile/intcode	Contact	Telecom	TelephoneNum	intcode
homeInfo/telecom/mobile/loccode	Contact	Telecom	TelephoneNum	loccode
homeInfo/telecom/mobile/number	Contact	Telecom	TelephoneNum	number
homeInfo/telecom/mobile/ext	Contact	Telecom	TelephoneNum	ext
homeInfo/telecom/mobile/comment	Contact	Telecom	TelephoneNum	comment
homeInfo/telecom/pager/intcode	Contact	Telecom	TelephoneNum	intcode
homeInfo/telecom/pager/loccode	Contact	Telecom	TelephoneNum	loccode
homeInfo/telecom/pager/number	Contact	Telecom	TelephoneNum	number
homeInfo/telecom/pager/ext	Contact	Telecom	TelephoneNum	ext
homeInfo/telecom/pager/comment	Contact	Telecom	TelephoneNum	comment
homeInfo/online/email	Contact	Online		email
homeInfo/online/uri	Contact	Online		uri
businessInfo/postal/name	Contact	Postal		name
businessInfo/postal/street	Contact	Postal		street
businessInfo/postal/city	Contact	Postal		city
businessInfo/postal/stateprov	Contact	Postal		stateprov
businessInfo/postal/postalcode	Contact	Postal		postalcode
businessInfo/postal/country	Contact	Postal		country
businessInfo/postal/organization	Contact	Postal		organization
businessInfo/telecom/telephone/intcode	Contact	Telecom	TelephoneNum	intcode
businessInfo/telecom/telephone/loccode	Contact	Telecom	TelephoneNum	loccode
businessInfo/telecom/telephone/number	Contact	Telecom	TelephoneNum	number
businessInfo/telecom/telephone/ext	Contact	Telecom	TelephoneNum	ext
businessInfo/telecom/telephone/comment	Contact	Telecom	TelephoneNum	comment
businessInfo/telecom/fax/intcode	Contact	Telecom	TelephoneNum	intcode
businessInfo/telecom/fax/loccode	Contact	Telecom	TelephoneNum	loccode
businessInfo/telecom/fax/number	Contact	Telecom	TelephoneNum	number
businessInfo/telecom/fax/ext	Contact	Telecom	TelephoneNum	ext
businessInfo/telecom/fax/comment	Contact	Telecom	TelephoneNum	comment

businessInfo/telecom/mobile/intcode	Contact	Telecom	TelephoneNum	intcode
businessInfo/telecom/mobile/loccode	Contact	Telecom	TelephoneNum	loccode
businessInfo/telecom/mobile/number	Contact	Telecom	TelephoneNum	number
businessInfo/telecom/mobile/ext	Contact	Telecom	TelephoneNum	ext
businessInfo/telecom/mobile/comment	Contact	Telecom	TelephoneNum	comment
businessInfo/telecom/pager/intcode	Contact	Telecom	TelephoneNum	intcode
businessInfo/telecom/pager/loccode	Contact	Telecom	TelephoneNum	loccode
businessInfo/telecom/pager/number	Contact	Telecom	TelephoneNum	number
businessInfo/telecom/pager/ext	Contact	Telecom	TelephoneNum	ext
businessInfo/telecom/pager/comment	Contact	Telecom	TelephoneNum	comment
businessInfo/online/email	Contact	Online		email
businessInfo/online/uri	Contact	Online		uri

Portlets that need access to user information declares in its metadata the specific user profile fields it needs using the names specified above.

Consumers supplying additional custom profile fields are encourage to publish a similar mapping between `userProfileItems` and the custom fields.

15.1 Passing User Information

User information can be supplied to the Producer when a Consumer invokes certain operations. A Consumer SHOULD provide the specific fields the Portlet declared it needs, unless the information is not available or is restricted by policy (e.g. privacy policy).

15.2 User Identity

Mechanisms that support federation of user identity between web services systems are defined in other specifications, such as WS-Security and SAML. If a Consumer and Producer need to share a common identity for an End-User, it is recommended that compliance with these standards be the means to passing the required information.

It is anticipated that some Portlets will interact with one or more back-end applications that require a user identity for the End-User. If the user identity required by the back-end application is not the same as that authenticated or otherwise supplied by the Consumer, the Portlet can request the End-User to provide the necessary information (preferably using secure transport) for use with the back-end application via markup interactions (e.g. display a form that prompts for a user identity and any security tokens (such as a password) for the back-end system).

16 Constants

Type	Value	Description
Mode	wsrp:view	Portlet is expected to render markup reflecting its current state.
Mode	wsrp:edit	Portlet is expected to render markup useful for End-User customization.
Mode	wsrp:help	Portlet is expected to render markup useful for helping an End-User understand the Portlet's operation.
Mode	wsrp:preview	Portlet is expected to render markup representative of its configuration, as this might be useful to someone testing a page layout.
Window state	wsrp:normal	The Portlet is sharing space with other Portlets and should restrict its consumption of space accordingly.
Window state	wsrp:minimized	The Portlet, though still aggregated on the page, is expected to restrict its consumption of space to a bare minimum.
Window state	wsrp:maximized	The Portlet is being offered significantly more that the normal share of the space available to Portlets on the Consumer's aggregated page.
Window state	wsrp:solo	The Portlet is the only Portlet being rendered on the Consumer's aggregated page.

17 Fault Messages

In addition to generic fault messages that may be generated by the web service stacks of the Consumer and/or Producer, a variety of messages specific to this protocol are defined. The following WSRP error codes are defined within the same namespace as the rest of the types defined by this specification. The SOAP 1.1 faultcode SHOULD be set to the WSRP error code being raised, namespace qualified to be in the "urn:oasis:names:tc:wsrp:v1:types" namespace. In addition, the SOAP 1.1 fault's detail element MUST contain the corresponding namespaced fault element from the WSRP v1 WSDL as its only content. When using SOAP 1.2, the Subcode element MUST be present and carry the corresponding WSRP error code in its mandatory Value sub-element. The Subcode element MUST be contained in a SOAP 1.2 Receiver fault code, for the fault messages defined in this specification. SOAP 1.2 faults MAY carry additional content in the Detail sub-element, but MUST carry the corresponding WSRP namespaced fault element.

Fault Code	Description
AccessDenied	Policy has denied access. This may be related to the Consumer's registration.
InconsistentParameters	Used when a Consumer supplies inconsistent parameters (e.g. when a `portletHandle` is not scoped by the supplied `registrationHandle`).

InvalidRegistration	Used when a Consumer supplies a `registrationHandle/registrationState` pair that is not recognized by the Producer. This includes when no `registrationHandle` is supplied, but a registration is required.
InvalidCookie	Used only when the environment at the Producer has timed out AND the Producer needs the Consumer to invoke **initCookie** again and resend data that may have been stored in sessions related to a cookie.
InvalidHandle	Used when the Consumer supplies an invalid `Handle`.
InvalidSession	Used only when a Producer session has timed out AND the Producer needs the Consumer to invoke resend data that may have been cached in the session.
InvalidUserCategory	The specified `userCategory` is not supported.
ModifyRegistrationRequired	Used when a modification to the information supplied during registration is required in order to continue using the registration.
MissingParameters	Used when required parameters are missing.
OperationFailed	Normal execution of the operation failed. Check the detailed message for reasons why.
PortletStateChangeRequired	Used when a Portlet needs to modify its persistent state, but has been prevented from doing so.
UnsupportedLocale	The Portlet does not support generating markup for the requested locale. Since the Portlet is not required to generate markup in the requested locale, a Portlet returning this fault message is indicating that it processes locales in a stricter manner and has no markup for the requested locales. The Consumer can treat this as a specialization of the OperationFailed fault message and does not have to retry getting the markup in other locales.
UnsupportedMimeType	The Portlet does not support generating markup for the requested mime type.
UnsupportedMode	The Portlet does not support generating markup for the requested mode.
UnsupportedWindowState	The Portlet does not support generating markup for the requested window state.

18 WSDL Interface Definition

Normative copies of the WSDL that MUST be referenced by Producers implementing this specification can be found at:

http://www.oasis-open.org/committees/wsrp/specifications/version1/wsrp_v1_types.xsd - The type, message and fault definitions for this specification. These definitions form the "`urn:oasis:names:tc:wsrp:v2:types`" namespace.

http://www.oasis-open.org/committees/wsrp/specifications/version1/wsrp_v1_interfaces.wsdl - The portType definitions for this specification. These definitions form the "`urn:oasis:names:tc:wsrp:v2:intf`" namespace.

http://www.oasis-open.org/committees/wsrp/specifications/version1/wsrp_v1_bindings.wsdl - The standard binding definitions for this specification. These definitions form the "`urn:oasis:names:tc:wsrp:v2:bind`" namespace.

In addition the TC has provided definitions in http://www.oasis-open.org/committees/wsrp/specifications/version1/wsrp_v1_extra.xsd for reuse in extension elements.

This WSDL defines the following portTypes:

1. **WSRP_v2_Markup_PortType:** All Producers MUST expose this portType.
2. **WSRP_v2_ServiceDescription_PortType:** All Producers MUST expose this portType.
3. **WSRP_v2_Registration_PortType:** Only Producers supporting in-band registration of Consumers need expose this portType.
4. **WSRP_v2_PortletManagement_PortType:** Producers supporting the Portlet management interface expose this portType. If this portType is not exposed, the Portlets of the service are not configurable by Consumers.
5. **WSRP_v2_CopyPortlet_PortType:** This portType exposes a Portlet factory that allows Portlets in a different registration be used as the basis for generating new Portlets.
6. **WSRP_v2_ImportExport_PortType:** This portType exposes a set of operations around a Portlet factory which allows the generation of a representation of set of Portlets which may be used to constitute equivalent Portlets at a later time and potentially using different web service endpoints.
7. **WSRP_v2_RegistrationLifetime_PortType:** Only Producers supporting scheduled destruction of registrations need expose this portType.
8. **WSRP_v2_PortletLifetime_PortType:** Only Producers supporting scheduled destruction of Portlets need expose this portType.

This WSDL defines the following SOAP bindings for these portTypes:

1. **WSRP_v2_Markup_Binding_SOAP:** All Producers MUST expose a port with this binding for the `WSRP_v2_Markup_PortType` (the `Markup` portType).
2. **WSRP_v2_ServiceDescription_Binding_SOAP:** All Producers MUST expose a port with this binding for the `WSRP_v2_ServiceDescription_PortType` (the `ServiceDescription` portType).
3. **WSRP_v2_Registration_Binding_SOAP:** Producers supporting the `Registration` portType MUST expose a port with this binding for the `WSRP_v2_Registration_PortType`.

4. **WSRP_v2_PortletManagement_Binding_SOAP:** Producers supporting the `PortletManagement` portType MUST expose a port with this binding for the `WSRP_v2_PortletManagement_PortType`.
5. **WSRP_v2_CopyPortlet_Binding_SOAP:** Producers supporting the `CopyPortlet` portType MUST expose a port with this binding for the `WSRP_v2_CopyPortlet_PortType`.
6. **WSRP_v2_ImportExport_Binding_SOAP:** Producers supporting the `ImportExport` portType MUST expose a port with this binding for the `WSRP_v2_ImportExport_PortType`.
7. **WSRP_v2_RegistrationLifetime_Binding_SOAP:** Producers supporting the `RegistrationLifetime` portType MUST expose a port with this binding for the `WSRP_v2_RegistrationLifetime_PortType`.
8. **WSRP_v2_PortletLifetime_Binding_SOAP:** Producers supporting the `PortletLifetime` portType MUST expose a port with this binding for the `WSRP_v2_PortletLifetime_PortType`.

Appendix A. Glossary (Non-Normative)

Action	A term often used elsewhere for what this specification calls “Interaction”.
Attribute	A distinct characteristic of an object. An object’s attributes are said to describe the object. Objects’ attributes are often specified in terms of their physical traits, such as size, shape, weight, and color, etc., for real-world objects. Objects in cyberspace might have attributes describing size, type of encoding, network address, etc. Salient attributes of an object is decided by the beholder.
Authentication	To confirm a system entity’s asserted principal identity with a specified, or understood, level of confidence.
Client	A system entity that accesses a web service.
Consumer	A system entity invoking Producers in a manner conforming to this specification. For example a portal aggregating content from Portlets accessed using the WSRP protocol.
End-User	A person who uses a device specific User-Agent to access a Web site.
Fragment	A piece of markup that is not part of a full document - part of aggregate - generally a markup language - can aggregate a set of fragments
Portal Page	Complete document rendered by a portal.
Portlet	Producer hosted component that generates content design for aggregating and processes interactions generated from that content.
Producer	A web service conforming to this specification.
Session	A finite duration interaction between system entities, often involving a user, typified by the maintenance of some state of the interaction for the duration of the interaction.
System Entity	An active element of a computer/network system. For example, an automated process or set of processes, a subsystem, a person or group of persons that incorporates a distinct set of functionality.
Time-Out	A period of time after which some condition becomes true if some event has not occurred. For example, a session that is terminated because its state has been inactive for a specified period of time is said to “time out”.
Uniform Resource Locator (URL)	Defined as “a compact string representation for a resource available via the Internet.” URLs are a subset of URI.
User-Agent	A system entity that is used by an End-User to access a Web site. A user-agent provides a run-time environment for distributed application components on the client device.
Web Service	A Web Service is a software component that is described via WSDL and is capable of being accessed via standard network protocols such as but not

	limited to SOAP over HTTP.
Web Site	A hosted application that can be accessed by an End user using a user-agent
WSRP Service	Presentation oriented, interactive web services that can be aggregated by consuming applications - WSRP services can be published, found, and bound in a standard manner, describing themselves with standardized metadata
XML (Extensible Markup Language)	Extensible Markup Language, abbreviated XML, describes a class of data objects called XML documents and partially describes the behavior of computer programs which process them. XML is an application profile or restricted form of SGML, the Standard Generalized Markup Language [ISO 8879] See http://www.w3.org/TR/REC-xml.
XML Namespace	A name, identified by a URI reference, which are used in XML documents as element types and attribute names. An XML namespace is often associated with an XML schema. See http://www.w3.org/TR/REC-xml-names/.

Appendix B. Common Values (Non-Normative)

There is significant value to defining values for various fields that Consumers and Producers share without having to map to different values with the same semantic meaning. The following sections define such common values.

B.1 Standard User Categories

To ease the mapping of End-Users to user categories and to facilitate plug-and-play, the following standard category names are provided along with an abstract definition of semantics associated with each. The specific semantics of these categories are left to each Portlet's implementation.

wsrp:full:	The content for this user category will typically encompass the full functionality of the Portlet.
wsrp:standard:	This user category is typically associated with End-Users who may customize some set of properties for a Portlet.
wsrp:minimal:	This user category is typically associated with End-Users who may view a Portlet on a page but not modify any of its properties

Appendix C. Data Structures List (Non-Normative)

The following lists the data structures this specification defines including the section numbers for the defintions.

BlockingInteractionResponse (6.1.176.1.15)
CacheControl (6.1.5)
ClientData (6.1.7)
CookieProtocol (5.1.19)
DestroyFailed (8.1.1)
DestroyPortletsResponse (8.1.2)
Extension (5.1.1)
Handle (5.1.2)
ID (5.1.4)
InteractionParams (6.1.226.1.19)
ItemDescription (5.1.9)
Key (5.1.3)
LocalizedString (5.1.5)
MarkupContext (6.1.136.1.11)
MarkupParams (6.1.116.1.9)
MarkupResponse (6.1.136.1.11)
MarkupType (5.1.10)
ModelDescription (5.1.18)
ModelTypes (5.1.17)
NamedString (6.1.106.1.8)
PortletContext (6.1.3)
PortletDescription (5.1.12)
PortletDescriptionResponse (8.1.3)
PortletPropertyDescriptionResponse (8.1.4)
Property (5.1.13)
PropertyDescription (5.1.16)
PropertyList (5.1.15)
RegistrationContext (5.1.23)
RegistrationState (5.1.21)
RegistrationData (7.1.1)
ResetProperty (5.1.14)
Resource (5.1.7)
ResourceList (5.1.8)
ResourceValue (5.1.6)
RuntimeContext (6.1.2)
ServiceDescription (5.1.20)
SessionContext (6.1.1)
StateChange (6.1.186.1.16)
Templates (6.1.6)
UpdateResponse (6.1.146.1.12)
UploadContext (6.1.216.1.18)
UserContext (6.1.266.1.23)
UserProfile (6.1.236.1.20)
- Contact Type (6.1.25.76.1.22.7)
- EmployerInfo (6.1.25.26.1.22.2)
- Online (6.1.25.56.1.22.5)
- PersonName (6.1.25.16.1.22.1)
- Postal (6.1.25.66.1.22.6)
- Telecom (6.1.25.46.1.22.4)
- TelephoneNum (6.1.25.36.1.22.3)
UserScopes (6.1.4)

Appendix D. Acknowledgments (Non-Normative)

D.1 WSRP committee members

The following individuals were members of the WSRP committee during the development of this specification (* indicates voting member when specification was finalized):

- Alejandro Abdelnur*, Sun Microsystems
- Sasha Aickin*, Plumtree Software
- Subbu Allamaraju*, BEA SYSTEMS INC
- Olin Atkinson*, Novell
- Atul Batra*, Sun Microsystems
- Amir Blich*, SAP
- Chris Braun*, Novell
- Jeff Broberg, Novell
